CONTENTS

Dedication 7
Acknowledgments 8
Introduction 9

BOOK ONE — FROM THE PAST AND INTO THE PRESENT

Chapter one — Traces of the past 13
Chapter two — We are all a part of the universe 21
Chapter three — Cognitions and explanations 24
Chapter four — They even knew how to use it 31
Chapter five — Relation between energy and matter 36
Chapter six — The energy of air and water 49
Chapter seven — Water isn't just for drinking 58

BOOK TWO — NOTHING IS IMPOSSIBLE

Chapter eight — Even good can become evil 71
Chapter nine — Harmony of heaven and earth 80
Chapter ten — Pyramids – accumulators, batteries and generators 100
Chapter eleven — The purpose and shapes of pyramids 104

BOOK THREE — THEORY OF A FREE MIND

Chapter twelve — Energetics of the pyramid 109
Chapter thirteen — Secrets of the stone spheres 121

BOOK FOUR — THE BOSNIAN PYRAMIDS

Chapter fourteen — The Visoko pyramids 139
Chapter fifteen — Archeological and geological evidence 140
Chapter sixteen — Comparison of the findings 144

BOOK FIVE BIOENERGETIC PULSATORS

Chapter seventeen The music-making of energy pulsators 147
Chapter eighteen Seismicity of the Sarajevo area 149
Chapter nineteen Interpretation of the symbols on megalith K-1 151
Chapter twenty Energetic geometric symphony at work 157
Chapter twenty-one Conclusions 159

Bibliography 163
About the authors 169

FROM THE PAST AND INTO THE PRESENT

CHAPTER ONE

TRACES OF THE PAST

Contemporary physics considers the universe, along with everything on Earth, to be made of eternal pulsating waves of something, which nobody knows what is, but it is believed that it must be something electric. Along with the development of this hypothesis, the field theory was also developed, which encompasses the relativity theory and the quantum theory. In his book „Evolution of Physics", Einstein wrote: „For a physicist, this field is quite as real as the chair he is sitting on."

In one of the oldest writings that has been preserved, „Emerald Tablet of Hermes", there is an axiom: What is up is identical to what is down, and what is down is identical to what is up... it is a great power among powers, which permeates each subtle thing and penetrates each solid matter. This axiom was confirmed by Nikola Tesla who said: There is no dead matter, because everything in the endless universe is vibrating, moving and living. The time since mankind has inhabited our planet Earth has not been measured to any degree of certainty, and we do not know the age of old buildings, like the pyramids. According to archeological research, it was confirmed that the feet of man and dinosaurs have walked the same temporal layer. Traces between 250 and 300 million years old were found in Utah in 1968, and along the Mississippi in the state of Kentucky in 1969. To make it even weirder: the dinosaur's contemporary wasn't even barefooted; instead, he wore sandals.

The decay of civilizations at intervals in the past is known and scientifically confirmed, but the reasons are not. There are many writings and traces of a great flood that seized our planet, and some explanations can be found in different sources:

- When this came upon the earth, I watched earth as it was swallowed by a great void, mountains heaving themselves upon mountains, hills descending into hills, and tall trees uprooted, thrown down and sinking into the void...

(Book of Enoch)

- The land in the ocean is destroyed, its citizens dead...

(Inscriptions from the Xochicalco pyramid in Mexico City)

- The Egyptians are descendants of a son of Toth, an Egyptian priest from Atlantis... *(Inscriptions on the Lion's Gate in Mycenae)*

A superficial look at the world map shows us that the outlines of the continents' shorelines are similar. This was noticed by the English philosopher Francis Bacon in 1620, but it was considered incidental for many years thereafter. Nobody could as much as imagine that anything could move these immense heaps of rocks.

German meteorologist Alfred Wegener published a map of the Earth's surface in 1915, according to which all the continents were a single land mass in the ancient past, which he called Pangaea.

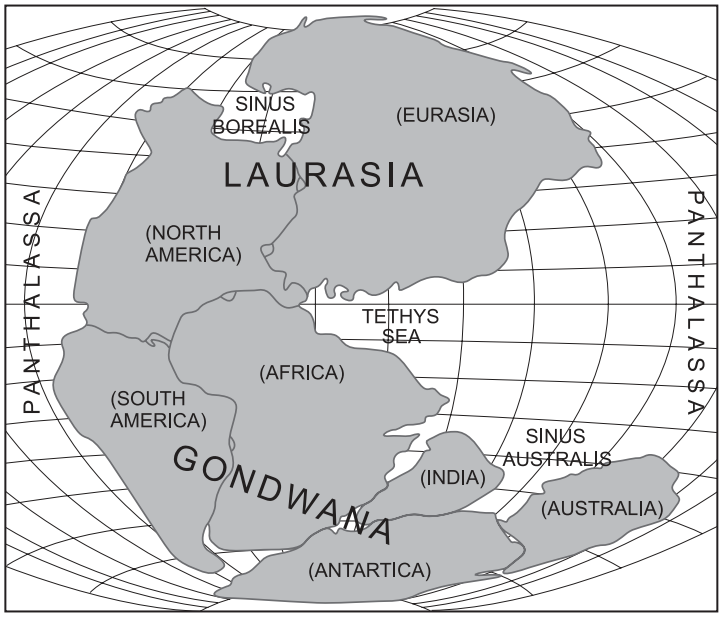

Figure 1. Pangaea – a common ground

In the course of creating his theory, Wegener relied on physical geology research, as well as concepts from geodetics, geophysics, paleontology, zoology and paleoclimatology.

He raised logical questions: why are the world's mountain ranges chained – the Himalayas, the Rocky Mountains, and the Apennines – while the rest of land is flat. How is it possible that we find fossils of marine animals in the highest mountains? How could tropical plants grow in Europe, or even in Greenland in ancient times? Where do the fossil palms on islands close to the North Pole come from, or coal in the Antarctic?

For the time being, science maintains that continental masses are moving and that the land we live on is moving. Wegener's theory was eventually accepted, and a crater on the visible side of the Moon was named after him. Today we know

that the lithosphere is divided into plates which are floating on semi-melted subterranean sea of lava, transferring warmth onto the surface of the Earth.

Figure 2. Continental drifts

At the beginning of the 19th century, dinosaur bones were found in England, and paleontologists agree on the fact that dinosaurs have suddenly died out some 65 million years ago.

Fossil findings from all around the world have unambiguously led to the conclusion that such mass extinctions happened many times during Earth's ancient history.

During the analysis of fossil remains of many animal species, paleontologists David Raup and John Sepkoski from the Chicago University have concluded that cataclysms on Earth happened cyclically, in nearly identical time intervals.

A group of scientists from the University of California, led by Luis Alvarez, a winner of the Nobel Prize for physics, detected an amount of iridium which was 160 times higher than usual in a geological layer created during the Cretaceous period. This hints at a meteor strike, since meteors are very rich in this rare element. This opens a possibility that an oblique layer of fine dust was created in the Earth's atmosphere and stratosphere, which prevented the rays of the Sun from reaching the surface of the Earth and, thus, plants withered, temperatures decreased, and the results were hunger and freezing.

A team led by Erle Kauffman, a Colorado University professor, discovered another four biological cataclysms during the Cretaceous period.

Other scientists from around the world have joined the research at that point, along with the Chicago team. Raup and Sepkoski, impressed by the work of Princeton scientists Alfred Fisher and Michael Arthur, compiled a list containing each genus of marine animals that ever existed, including the date of their initial appearance, as well as the date of their disappearance.

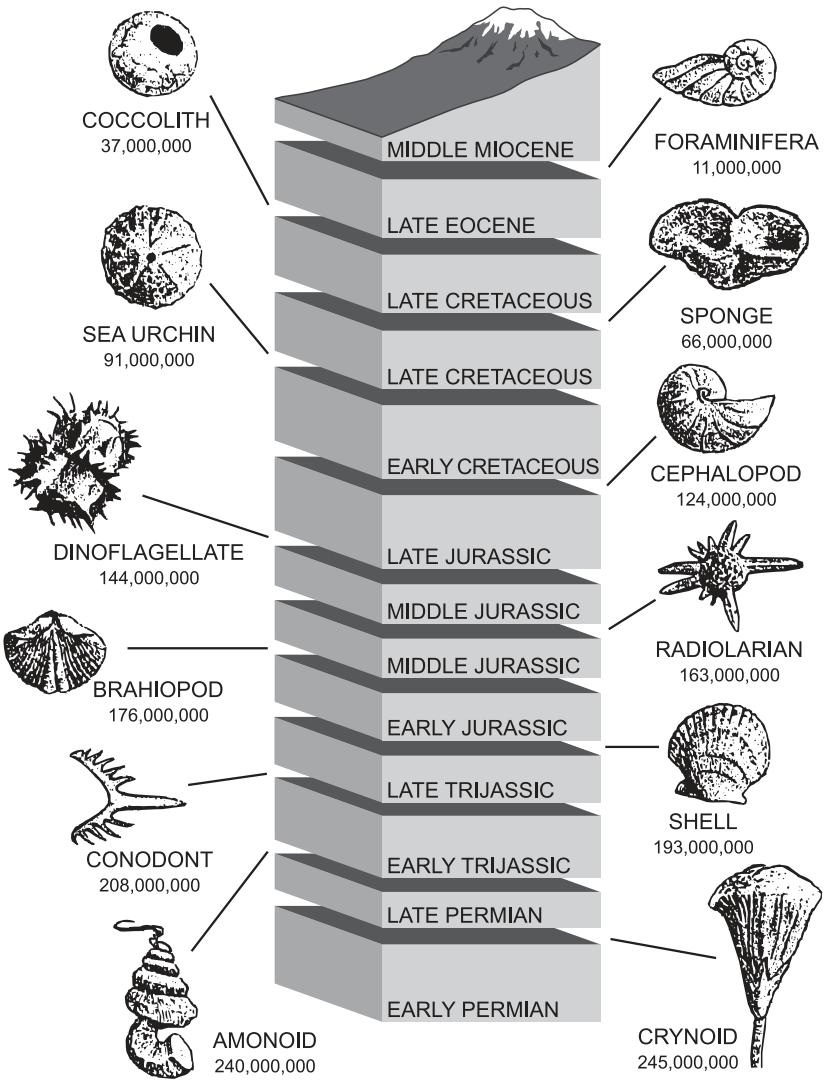

Figure 3. A list of genera of marine animals

The collected data on 3,500 genera of marine animals was processed by a computer, aided by very subtle statistical methods. What they got was a review of biological cataclysms over the past 250 million years, which they published in Flagstaff, Arizona. The calculation demonstrated that the cataclysms on Earth happened in regular time intervals of 26 million years.

The Sahara desert was literally green 12,000 years ago, which is testified by the Tassillé drawings, discovered by Henri Lot, with sights of boats, rivers and fishing. Here's the most interesting issue: at the bottom of the Pyramid of

Cheops there is a visible horizontal line at a height of approximately two and a half meters, bearing witness to a mass of water which stood there for a long time. This evidence questions the age of the pyramid, which seems to have been there even before the great flood.

All the pyramids that were discovered thus far, along with the stone towers in Ireland and other stone megaliths, were built at points of particular tellurian sensitivity, at particular ganglions of the Earth, in places where the transubstantiation of matter into energy takes place, and vice versa. A Taoist notion says that our planet is entangled in a network of force lines, through which the "chi" energy is flowing. The intersections of force lines and junctions are places of an increased energy radiation from the earth, which they called Dragon paths.

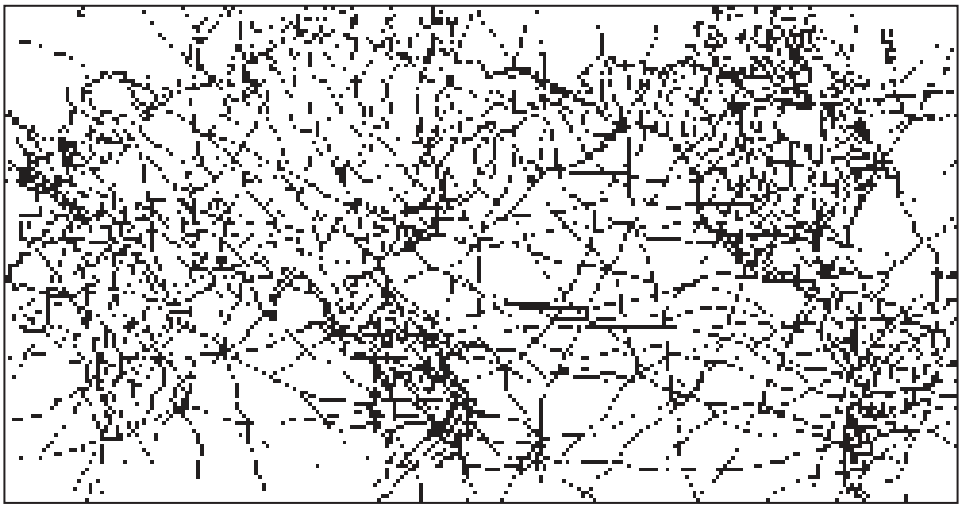

Figure 4. Dragon paths

THE ENIGMA OF THE EQUILATERAL TRIANGLE

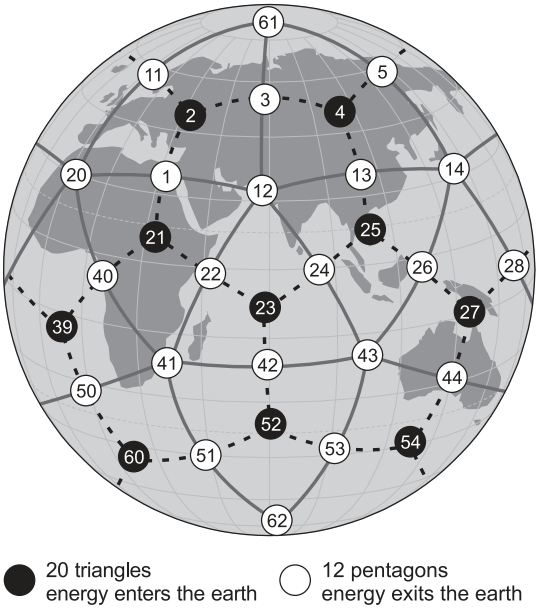
All over the world, there are ornaments with equilateral triangles on Neolithic pottery. Triangle symbols are quite usual on attires of old civilizations, from Native Americans to pharaohs. As a symbol, triangles are also represented in ancient architecture. In Mycenae, there are equilateral triangles carved above the Lion's Gate and above the entrance to the Treasury of Atreus, and they can also be found in sanctuaries all over the world, as well as in fortifications and temples.

We can also add all pyramidal structures to this list, the most famous of which is Khufu's pyramid (also known as the Pyramid of Cheops), which has a triangle-shaped door in the middle of its northern base. This leads us towards

the notion that the geometrical shape of the equilateral triangle is connected to energetics. N.F. Goncharov reached the same conclusion when he marked each focus of ancient cultures and civilizations on a globe. While analyzing the geographic locations of ancient civilizations, the globe revealed a pattern, and when Goncharov connected the focal points with lines, it became obvious that the surface of the Earth was covered with twenty equilateral triangles. When all intersections of the medians are connected with lines, a new geometrical network is revealed, consisting of twelve identical equilateral pentagons.

Many interesting pieces of information were obtained by means of the scientific research which was thus far conducted around the world. It was demonstrated that all anomalies of the Earth's magnetic fields were located in some of this system's nods, and in most cases in the triangle centers. The majority of the minimum and maximum atmospheric pressure on Earth is also located at these nodes. In the nodes of this system, there are also endemic plants and animals, which cannot be found elsewhere. This is especially true for particular species, as well as sizes, from short stature to gigantism. The influence of earthly and cosmic forces on the flora and fauna can't be ruled out. There are legitimate assertions that energy rises from the depths of the Earth along the edges and nodes of the triangles, and then again descends into the Earth at certain point along the edges and centers of the pentagons.

Plethora of research, and the information it revealed, testify that the ancient civilizations knew about this apparently crystalline shape of the terrestrial sphere, and about its energy flows, which they abundantly used.



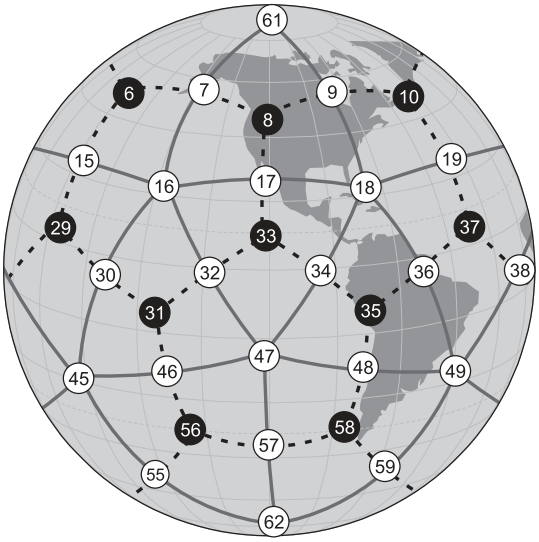


Figure 4a. Icosidodecahedron system of the Earth (IDSZ) on a map of the Earth's hemisphere according to N.F. Goncharov

- Centers of the anomalies of the Earth's magnetic field – nodes of the triangles 4, 6, 8, 29, 54, and the pentagon 49
- Constant areas of origin of hurricanes – points 18, 12, 27, 14, 45, 31
- Main centers of maximum and minimum atmospheric pressure – points 4, 6, 10, 12, 19, 27, 42, 44, 46, 48, 50

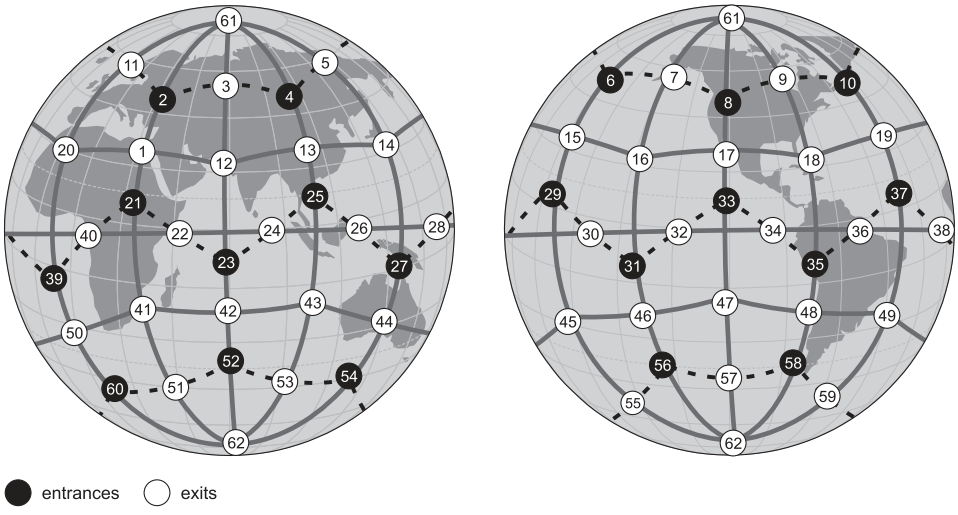

Figure 4b. Energy longitudes and latitudes

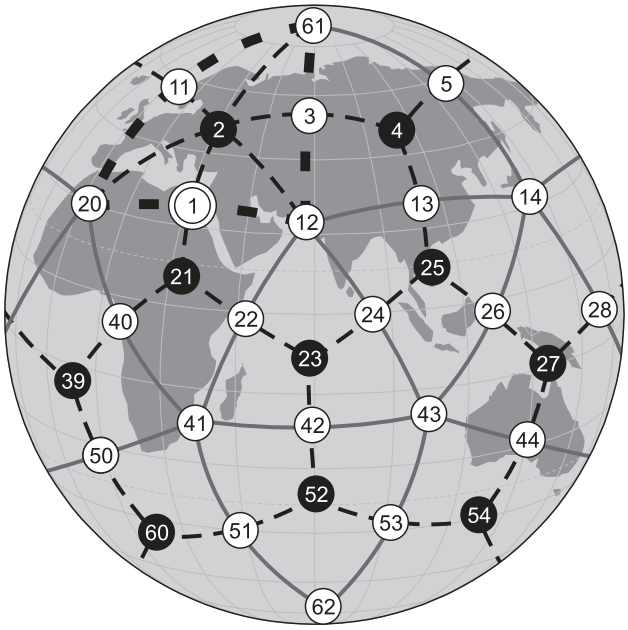

Figure 4c. With the division of the basic triangle into subsystems, we obtain a line of energy intersections across Bosnia and Herzegovina. The area of the Egyptian pyramids is denoted on the node (one).

That the pyramids are much more than just tombs was demonstrated by Dr. Louis Alvarez' and Dr. Goneida's experiment in Cairo in 1968. An invention by Dr. Alvarez, who won the Nobel Prize for physics, was intended to discover cavities and secret passages inside the Pyramid of Kephren. It was an incredibly expensive feat, as well as completely unsuccessful. What Alvarez' devices managed to demonstrate was the image of a playful interior. The disappointed Alvarez said to a correspondent of the London „Times": „The results we obtained are scientifically impossible – our results were influenced by some force that is beyond explanation, regardless of whether we call it occult, a pharaoh's curse, or black magic; in any case, there is a force outside physical laws, which is manifested inside the pyramid."

CHAPTER TWO

WE ARE ALL A PART OF THE UNIVERSE

According to Nikola Tesla, we are born into and live all our life within a gigantic spherical capacitor, where the earth is polarized with a negative, and the ionosphere with a positive charge, with a potential difference in charge of no less than 2.5 million Volts between the upper ionosphere level and the Earth.

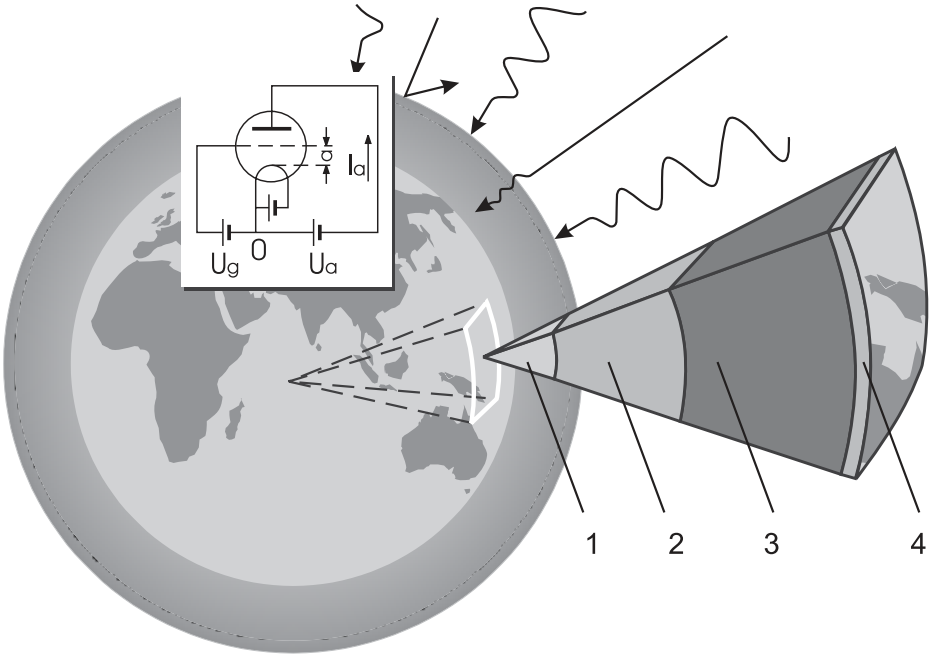

Figure 5. Earth as a spherical capacitor

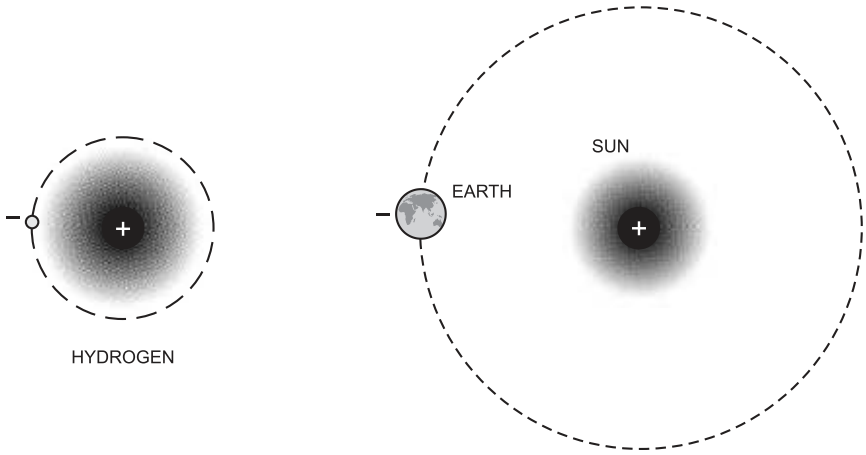
1. solid substance 1,000 km
2. magma 2,000 km
3. basalt rocks with admixtures 2,900 km
4. silicon with admixtures and ores 70 km

We could think of the Earth and the ionosphere as a gigantic tube through which ionic currents are constantly flowing, between the ionosphere as an anode, and the Earth as a cathode. This imaginary tube also has its own heating, represented by the magma below the earth. Constant ionic currents and discharges

are increased in high mountains and on tall structures. The sun replenishes the charges of the ionosphere, thus retaining unmodified tensional relationships. Since electric charges condense at the surface of spherical conductors like our Earth, we can determine that the zero-point field is at the very center of the Earth. The energetic electric field between Earth as minus, and its ionosphere as plus, is the subtle atmosphere of the world where we live. The development of radio technology confirmed the specific properties of the ionosphere that surrounds our Earth, where radio waves bounce off and return to the Earth.

If we take a segmented look at the Earth for a moment, and if we look at the ionosphere as an electronic tube, diode or triode, it will be much easier for us to understand the anode currents that flow from the ionosphere toward the Earth, as well as many other effects that occur there.

THE COMPARISON OF THE RELATIONSHIP BETWEEN MICRO AND MACRO UNIVERSE



a) b)

Figure 6.

The hydrogen atom contains one proton with a positive charge and one electron with a negative charge that has its „spin". Our Sun is a body with a positive charge, and the Earth, revolving around it, has a negative charge, and there are other celestial objects which we shall discuss later. The Earth revolves around the Sun and around its own axis.

The question is: what is the difference between a hydrogen atom on one side, and our Earth and Sun on the other?

The answer to this question is quite simple. The difference is in the mass and the speed of motion. Hydrogen has a low mass, and its electron moves rapidly. On the other hand, the Sun is very massive, and the Earth revolves slowly.

Let's take a look at our galaxy, with its billions of stars, where we, along with our Sun, are located somewhere at the outskirts of the upper part, and it's all moving, the upper part towards the right, and the lower part towards the left. In an endless universe, everything moves and pulsates.

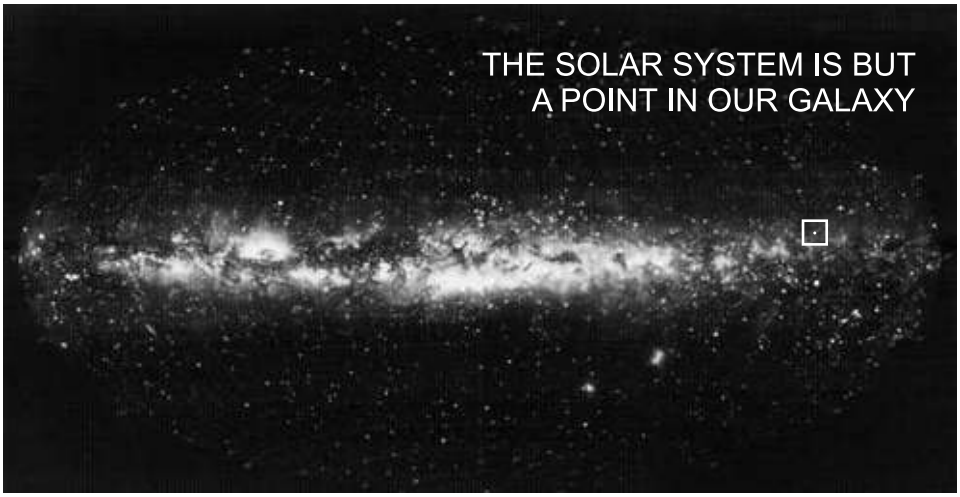


Figure 7. Milky Way

Do we have the right to say that the stars of our galaxy, or even the stars of other galaxies do not affect life on Earth? Of course we don't.

All the gear scientists in the world, those who died and those who are living, have researched paranormal phenomena and energy relations on which the wisdom of ancient civilizations is based.

The future of the leap into the universe, and the future of science in general, mostly depends on the progress of parapsychology, said one of the fathers of rocket technology, Herman Oberth.

Not long before he died, Nikola Tesla said: „Once science starts researching immaterial phenomena, it will make a more significant progress inside a decade, than it did in all the previous centuries of its existence."

CHAPTER THREE

COGNITIONS AND EXPLANATIONS

Many old stone buildings were probably built before the great flood, and many were certainly built later, like circular towers and different kinds and sizes of pyramids.

Buildings of such a shape are still being constructed, for example sacral objects for religious requirements, like mosques with a conical top and domes on accompanying objects, or Christian churches with cubical towers and either pyramidal or conical tops, with domes or dome-like dimensions of their interiors.

It seems that these types of constructions were used for a reason. It is a valuable heritage we inherited from old civilizations, with a huge energetic component.

These days, the geodesy of space helps us understand and measure the Earth's energy fields, enabling us to record the Earth's magnetic fields with satellites and special devices, its gravitational fields, and even ore deposits and other sites which are located below the surface of the Earth.

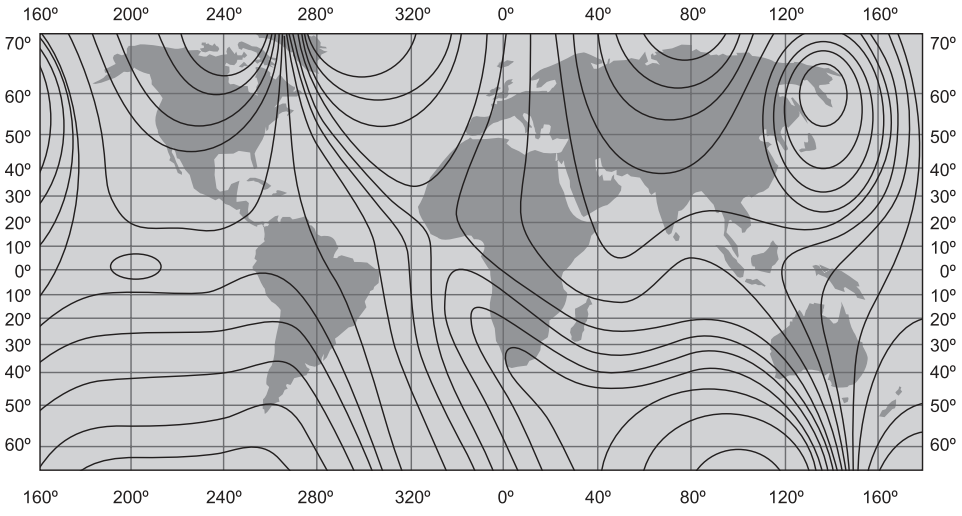

Figure 8. A map of the Earth's magnetic fields and their density

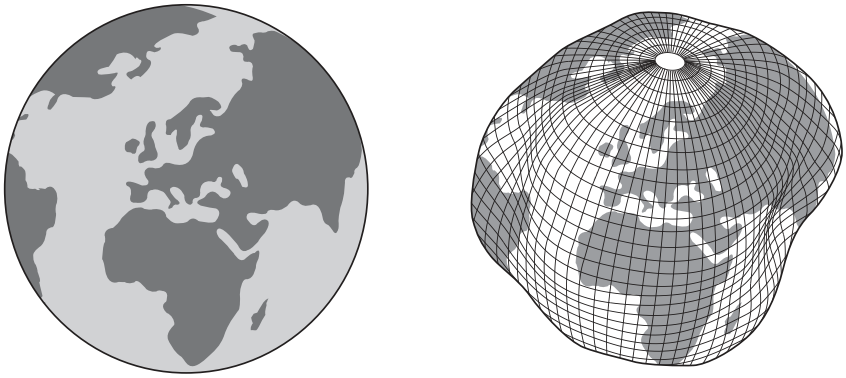

Figure 9. In regard to gravity, Earth is neither a sphere nor a spheroid

The shape of the Earth's gravitational field is more reminiscent of a potato than a sphere. The greatest irregularities are a 110 meter deep depression in the Indian Ocean, and a 65 meter high protrusion in the Atlantic. It is obvious that ancient civilizations were using the Earth's energy in the distant past, as well as the energy of space and the stars by raising huge blocks of stone in places with strong tellurian radiation, and by building stone towers and pyramids in order to use the energy we are about to discover.

Explorers have found a city overgrown with jungle plants in the jungles of Matto Grosso that, according to eyewitnesses, had a tall stone column in its central square, on top of which there was a sphere. The sphere illuminated the whole city by day and by night, with some unknown luminescent light, for all the centuries of its existence. In various places throughout the world, and on nearly all continents, there are still traces of the use of an omnipresent energy of space in the shape of various stone structures, megaliths, towers, and pyramids. These days, the prevailing belief is that these objects were observatories, tombs or sanctuaries built for ritual sacrificial purposes. A part of the buildings that were discovered can certainly be categorized as having that very purpose, but most of the objects built by ancient civilizations had completely different purposes, which we are still discovering. The sphere is the most ideal geometrical and energetic shape. We find countless spheres made of stone all over the world, small and big, perfectly sculptured, the intended use of which we didn't know until now. We also know that the shape of the hemisphere, which was later used as a dome on top of different buildings, is yet another ideal shape. The cone, or the dome, were often used shapes as a system of energy routing in any space or building. There are countless pyramidal stone buildings across the world. Pyramids were often used in the construction of energy objects in ancient civilizations. It is a crystal shape, which can be a three-sided or four-sided pyramid.

The question is: why did those ancient civilizations use these very shapes when constructing their objects? It is obviously that, in some empirical way, they knew what can be measured by instruments today. The density of the magnetic fields of the Earth's natural field is at its most dense at the top of buildings and summits of mountains, which is demonstrated on figure 10, as well as the fact that the lines of force of electric fields are vertical in regard to the sides of mountains and buildings.

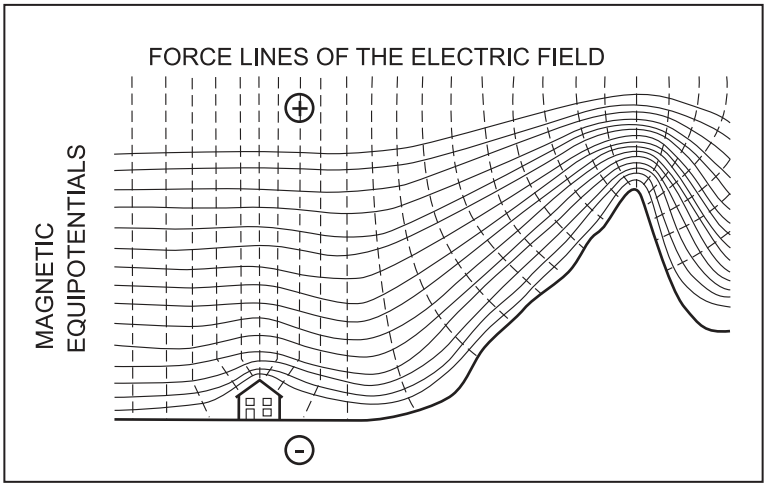

Figure 10. Electric field around an object

It is also known, as well as measurable, that the voltage in the field between the ionosphere and Earth increases for around 100 volts per meter of height (see Fig.11). A tall building made of stone, like a pyramid, has a dense magnetic field at its top.

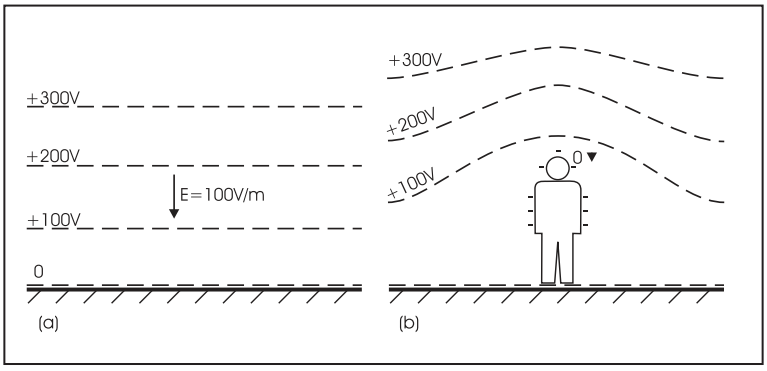

Figure 11. Electric field around a person

There is a whole set of shapes which were used, and still are, due to the specific relations in a magnetic field, especially in the construction of religious objects, like mosques and churches.

All these shapes of towers, cones, castle towers, pyramidal and dome-shaped buildings have, apart from sturdiness and exceptional construction effectives, a deeper meaning in the area of energetics and spirituality.

Objects that were built that way have a dense and increased positive charge at the top of the tower, and they also have a dense negative charge of the Earth, with its negative polarization in its interior, which increases the possibility of a smoldering ionic discharge at the top.

CHANGE OF THE LINEAR CONFIGURATION OF THE ELECTRIC AND MAGNETIC FIELD IN REGARD TO THE SHAPE OF THE OBJECT CONNECTED TO THE EARTH

We can assume that the objects that were built this way are resonators of the crucially important orgone energy, as well as collectors for the admission of the divine microwave energy of the stars, which makes as feel comfortable and calm, experiencing this comfort and peace of mind through cordial prayers.

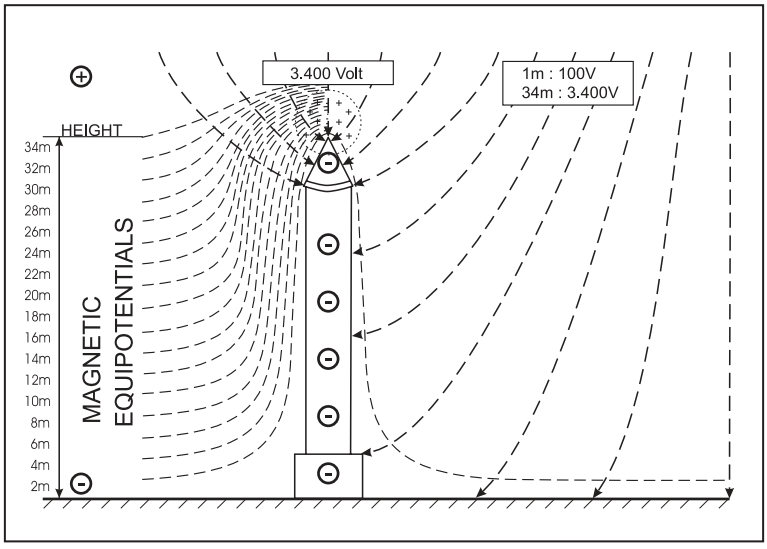

Figure 12. Electric field of a tower

Obelisks are the most frequently encountered monolith granite columns with a quadrangular section and a pyramidal termination at the top. Two obelisks were usually placed at the entrances of temples. They were covered with chiseled relieves, and the caps at their tops were covered in gold, silver, or copper.

We know that silver is the best conductor of electricity with the least resistance, followed by gold and copper. The crystal structure of the obelisk's body is an ideal antenna for all microwave and electromagnetic radiation, which makes it easy to understand that this system met its functional requirement of the energetic and useful pleasure of a sojourn inside sacral objects.

Ancient civilizations, as well as later ones, were using this simple way of energizing sacral objects. Christian architecture is recognizable by its pyramidal church towers and domes. Islamic architecture uses mosques with domes and minarets that were made of materials with equivalent properties, and the domes and tops of minarets were covered with silver, gold, and copper tin, just like obelisks.

Such a use of natural energetics has been known for ages, with one basic purpose: accumulating vital life energies, which was used for the greater good, for the mind and the body of every person who entered such an object.

Measurements demonstrate that sacral objects were mostly constructed in places with earthly telluric radiation, and made of paramagnetic materials that attract the magnetic and electric fields of the Sun and the stars.

Figure 13. An obelisk in front of the temple in Karnak

THE EARTH AND THE IONOSPHERE - A SPHERICAL CAPACITOR

Recent measurements have determined that the voltage difference between the Earth and the ionosphere is 400.000 volts, which is displayed on figure 14.

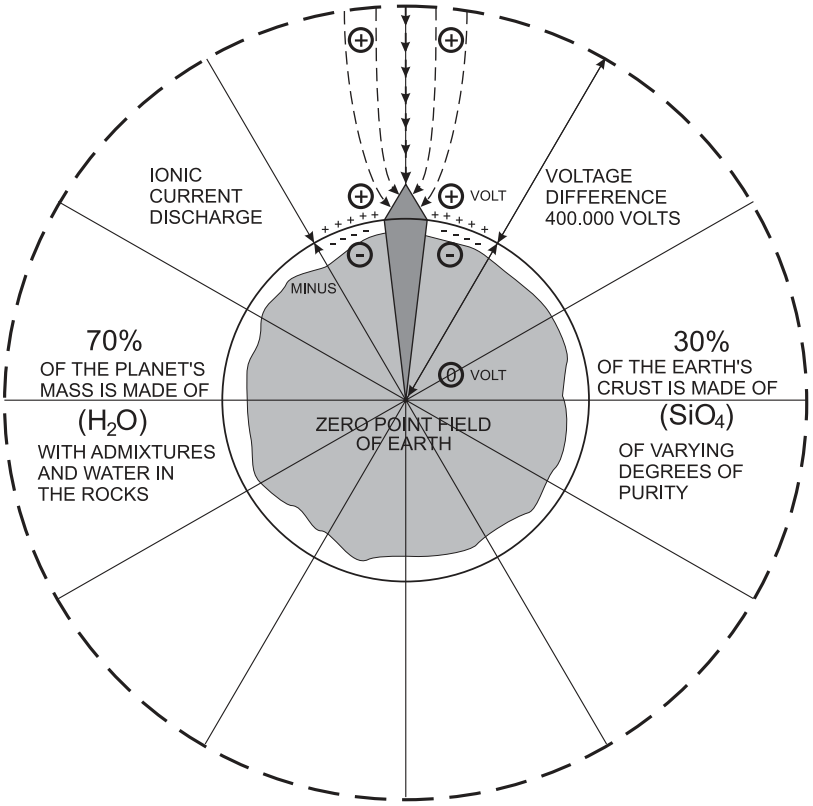

Figure 14. Electric field Earth – ionosphere

Secrets of the pyramids:

- It is like an iceberg in an ocean, of which only the top is protruding out of the Earth's entrails;

- Its effect starts with the Earth's zero-point field, and it ends in the expanses of the universe;

CHANGES OF THE LINEAR CONFIGURATION OF THE ELECTROMAGNETIC FIELD IN REGARD TO THE PYRAMID

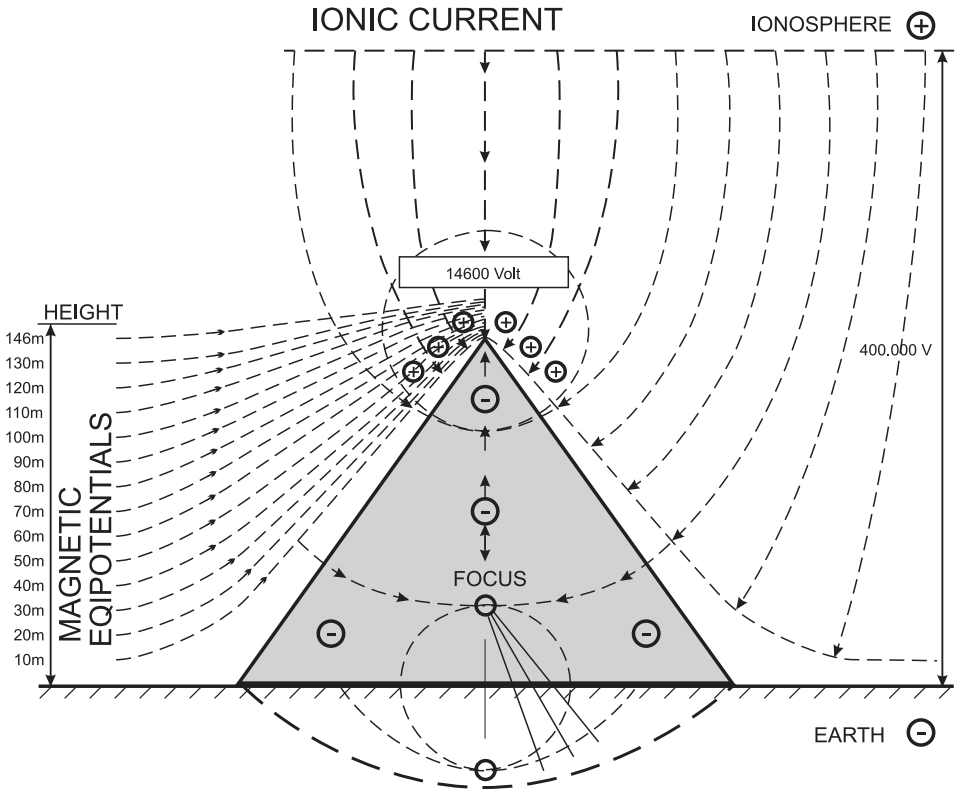

Figure 15. The pyramid's effect on the density of electric and magnetic fields Earth – ionosphere

- The force lines of the electric charge plus fields act vertically onto the sides of the pyramids
- Magnetic equipotentials show a great density of the magnetic field at the top.
- The electric field's voltage grows 100V/m in height.
- The Earth's minus field is greatest and at its most dense at the very top of the pyramid. The discharge lines of the focal charge – the voltage decreases with the diameter of the calotte.

CHAPTER FOUR

THEY EVEN KNEW HOW TO USE IT

To build their massive structures, ancient civilizations were mainly using basalt, limestone, sandstone and marble.

It is obvious that they cared about the crystal contents of their construction material, probably because of their specific properties which they acknowledged and abundantly used. Crystals can be induced to oscillate and brought into resonance with electric energy, termically, with pressure, sound, and by other means.

Silicon is actually a flinty, siliceous stone, and from a molecular point of view it contains one silicon atom and four oxygen atoms while, geometrically represented, it looks like a three-sided pyramid, as seen in figure 16.

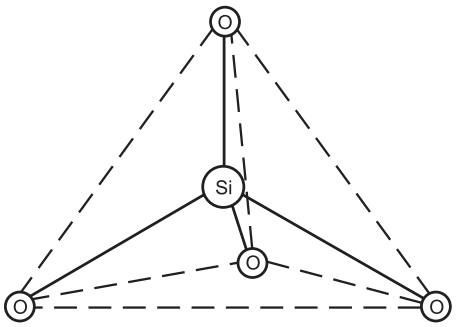

Figure 16. Illustration of the SiO_4 lattice (O = oxygen, Si = silicon)

If we take into account that quartz crystals in various degrees of purity make up to 30% of the Earth's crust, and that quartz crystals are frequently used in today's electronics, that it can be induced to oscillate in various ways, that it strengthens dimensional effects in the magnetic field, and that it is used for therapeutic purposes in today's alternative medicine, we might begin to understand why this substance was so appreciated and used by ancient civilizations in the construction of their structures.

Regardless of the brevity and conciseness of these explanations, I believe it must be emphasized that SiO_4, when immersed into a container full of water, changes its energetic value, which is manifested through the modification of the surface tension of the water.

IRISH TOWERS

The discoveries of Patrick Flanagan, who made it to the top ten list of the world's most respected scientists published by „Life" magazine at the tender age of 17, are particularly interesting and remarkable. To this day, Patrick Flanagan has over 300 recognized patents.

The research of the mysterious towers began during the Second World War, while Flanagan was stationed in Bellek, in Ireland.

He discovered that there are around 65 partly destroyed towers in the green areas of Ireland. One of the best preserved towers was located on Devenish Island, in the middle of Lough Erne. The tower is 25 meters tall and has a circumference of 15,4 meters. It is vertically divided into 5 stores with separately placed windows.

All Irish towers are made of limestone, sandstone, or basalt, which points to their paramagnetic construction. These towers could be massive electronic collectors of the microwave energy of the universe, Flanagan thought, but they could also be gigantic accumulators of magnetic energy (Fig.17).

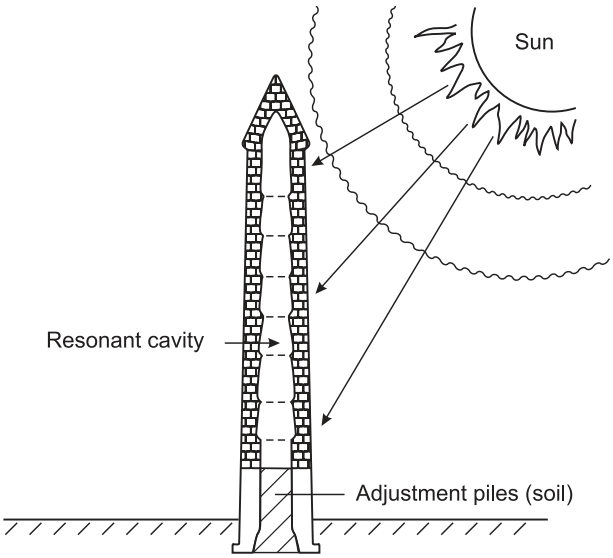

Figure 17. Schematic sketch illustrating the section of an Irish tower

The Kilmacduagh tower in Galway County in Ireland (Fig.18) is 34 meters tall, and it is the tallest among the round Irish towers which are, according to Philip S. Callahan, antennas for the reception of the magnetic energy of the universe. A part of the base below the entrance to these towers is filled with soil. According to Callahan, these could be piles of soil used for „adjustment" for the

shortening or lengthening of the paramagnetic stone antenna (from „Magnetic Antennae and Ancient Agriculture"). In order to prove his hypothesis, Flanagan made a model of the tower and immersed it into a pot full of a solution made of water and Epsom salt, and left it that way for 48 hours, hoping that the dissolved salt would be light enough to be affected by the minor forces of the model. He wasn't too surprised when he noticed that the model was marked around its outer side with spirals of white lines, from the peaked top down to the base.

The best high frequency antennas are not made of metal conductors, but rather of dielectric substances, which do not conduct electricity, like acrylic glass, wax and stone. While building these towers with substances rich in silicon, old Celtic friars were creating a gigantic resonant system for the collection and transfer of metric waves from the universe.

Figure 18. Kilmacduagh tower in Ireland

The towers are magnetic antennas or, actually, massive electronic collectors of microwave energy from outer space, and gigantic accumulators of magnetic energy.

They provided this energy of the universe to the plants in their fields, many centuries before the word „electronics" entered our daily language. By day, the towers resonated to the magnetic energy sent by the sun, and by night they received wavelengths at 14,6 meters, as sent by the stars (Fig.19).

The operation of these towers perfectly fits into the life of the plants, which release diamagnetic oxygen during sunny hours, while becoming paramagnetic and night, releasing paramagnetic carbon dioxide.

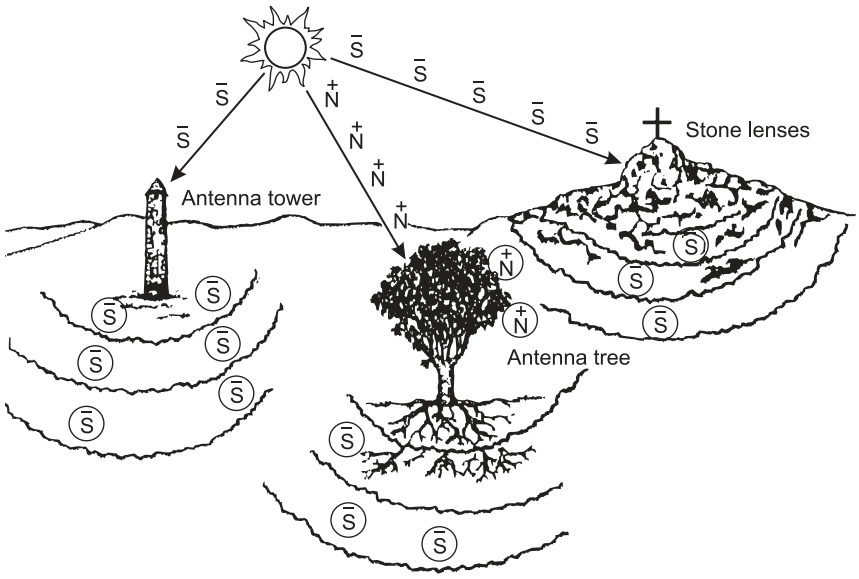

Figure 19. Arrangement of magnetic poles in nature

Because of this, the planted flora was growing faster at the foot of the towers, and especially in the northern part, below the tower (from the book „The secret life of the ground").

The first practical experiment was performed simply out of curiosity, in 1986 in Arkansas, on the West Menhis estate, which was owned by Thomas C. Quackenboss. On a 200-hectare area, he raised three terracotta tubes with a diameter of 30 cm and a height of two meters, which he filled with highly paramagnetic basalt granulate, and covered it with a pyramidal basalt cap. That summer, his crop yielded an additional 8,000 Dollars.

Next year, the Quackenbosses constructed 21 terracotta towers on their estate, duly paying attention to the fact that each tower should be built on an intersection of earthly telluric radiations.

Even though it was a very dry season, and the surrounding farms suffered a decrease in crops, the Quackenboss estate enjoyed enough precipitation, and their crops increased several time compared to last year.

Another tower experiment was conducted in Virginia, on Jim Wheat's estate. He built 17 towers on an area of 1,000 hectares. The following harvest made him 50,000 Dollars richer.

This is just a short review, as well as a fascinating indicator of the knowledge our ancestors were using.

WHAT ELSE ARE THE SECRETS OF VANISHED CIVILIZATIONS HIDING FROM US?

We know that they were using some energies which current physics and classic medicine are still unaware of.

They were using mental suggestions and sending telepathic messages over distances, thus communicating with people, plants, and animals.

They were using group biotherapies, applying plant and animal bio-fields in order to cure themselves.

They knew how to decrease gravitation and transport heavy objects by decreasing their weight.

They knew how to soften substance and knead it like dough.

They were frequently using crystal powers.

When praying and telepathically sending mental messages, they added a gravitational component to their words, turning heavy prayer wheels and manual spinning tops with weights, the way lamas do it in Tibet today.

All of the aforementioned somehow fits the domain of parapsychology, the psychic ability area, the extrasensory perception area, or should we call it paraphysics.

Paraphysics was explained long ago with a single sentence: Paraphysics is where the light of a candle meets and touches the dark of night.

At a manifest of parapsychologists in Moscow in 1968, a new designation was adopted, „psychotronics“, which is used to determine and confirm that there is a real influence of the spirit on physical substance. Czech technologist and parapsychologist Robert Pavlita certainly had a share in this, by demonstrating psychotronic generators. This way, wisdom that was used before us for thousands of years by ancient civilizations, using the energy of the Sun, the stars, and the human mind, constructing peculiar buildings such as stone spheres, pyramids, and Irish towers of power, was eventually formally acknowledged in 1968. But make no mistake: it is necessary to say that the most subtle energies, which will be discussed hereafter, do not belong to the previously known and acknowledged radiations of the electromagnetic spectrum, nor are they Hertz waves, even though they can be carriers of these energies.

CHAPTER FIVE

RELATION BETWEEN ENERGY AND MATTER

The relation between matter and energy quantums (photons) = 1:9,746 x 108, a small point (Fig.20) representing the existing mass, surrounded by reciprocating forces (photons). This mass corresponds to the area of the city of Leonberg in comparison with all of the Earth's surface (according to Carlo Rubbia, 1984 Nobel Prize laureate).

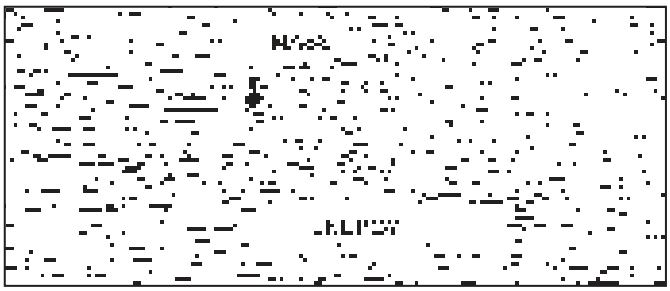

Figure 20. Illustration of the ratio between mass and energy in the universe

A brief way to say it would be: matter is created through the thickening of energy. By itself, matter is completely unstable. It only becomes stable through mutual/reciprocating forces, which shape it and give it properties. The ratio between these forces and matter is 1 billion : 1, i.e. they are so much more represented in the universe than visible matter. Mutual/reciprocating forces belong to a higher idea, and they ensure a high degree of order.

WHAT DOES SPIRIT MEAN TO PHYSICIANS?

Here's a conclusion reached by physicists:

If we divide 1 gram of a mass with a billion, and if we divide the result with billion six further times, and if we divide the derived result with 100, the result is almost spirit – energy almost entirely without mass, ions with 10-4 gram/mass which permeates all living and lifeless matter.

Actually, this would still be a material particle, not spirit, because real spirit is an offshoot, i.e. a part of the human soul. It is life that was breathed into us.

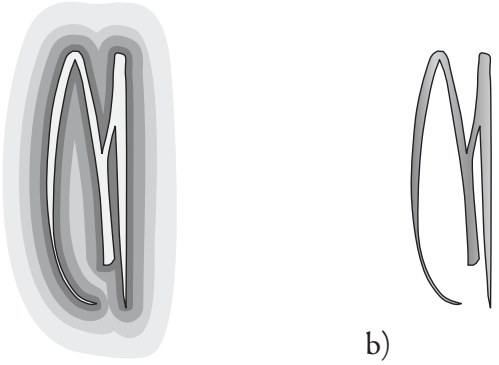
The comparison with the spirit is linked to the expression „massless“, as an expression for the immaterial, invisible, yet existing.

BIOPHOTONS AND BIOPHOTONIC RADIATIONS

Living cells radiate a weak light, which can be measured and displayed with the help of a computer. Prof. Dr. Fritz Albert Popp calls this light emission biophotons. It might be similar to the aurae of Fig. 21 a) and b).

a) b)

Figure 21. A snapshot of leaves before and after recording biophotonic emissions a) Leaves in a container before testing the emission of biophotons. b) A leaf, whose emission of biophotonic light was enhanced and graphically displayed with the help of a computer. The lighter the color, the stronger the radiation!



a) b)

Figure 22. The living light of grass

The „living light“ of a leaf of grass, enhanced by the use of a special device. The same leaf can be seen on the smaller image (to the right) prior to the biophotonic measurement.

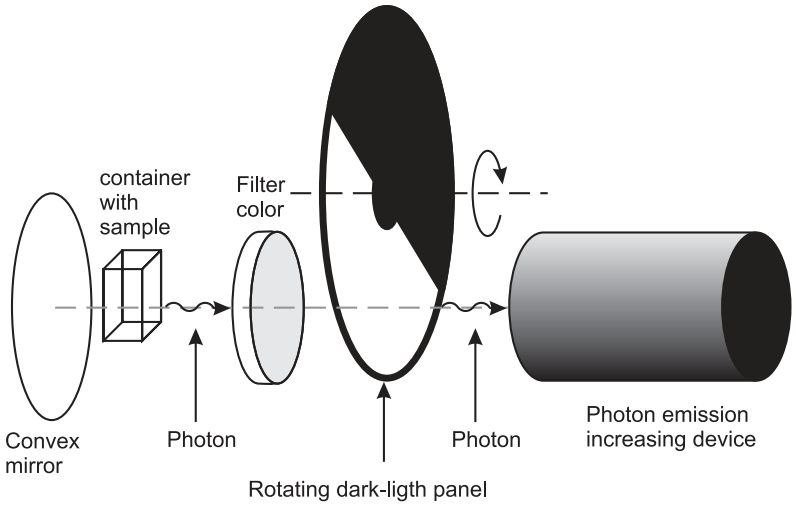


Figure 23. Working principle of a biophotonic recording device

AURA – A BIOPHOTONIC FIELD AROUND THE BODY

Figure 24. An illustration of the aura, and the aura field around an astronaut on the moon

Dr. Popp has proven that biophotons create a biophotonic field around the whole body, emitting light at the same time. In esoteric circles, this discovery is considered to be scientific proof of the existence of the aura, something that

all sensitives from all ages are talking about. However, Dr. Popp is too much of a scientist to mention the aura. In order to make a statement about the aura, „everything covered by that expression should be specified", Dr. Popp warns us. „However, those who speak about the aura certainly mean something that can be measured." Frequency fields can be recorded and color images of the aura can be obtained.

ORGONE OR LIVING ENERGY

From the „Kreman Prophecy" – (Mitar Tarabić)

Quote:

People will drill wells in the ground and pull black gold out of them, which will turn everything and give them light, speed, and strength, but the earth will cry with sadness, because there will be more gold and light on its surface than in its interior. It will hurt with all these open wounds.

Instead of reaping and making haystacks, people will dig everywhere, where it's appropriate and where it isn't, even though the force will be all around them, since it won't be able to say:

Come on, take me, can't you see I'm here, all around you?

Only after many a year, people will remember that true force, and realize what kind of stupidity they did with their holes. This force will live inside the people themselves, but lots of time will pass before they will find out how to use it. And so, man will live for a long, long time before getting to know himself. There shall be many different sages who will believe they have learned everything through their books. These people will be a major obstacle to obtain the knowledge, and once when people find out and learn, they will realize how wrong they were to listen to these sages... when this happens, people will be sorry for not learning it sooner, because this wisdom is entirely simple."

End quote.

- There are fields in the field of human life, which are analogous to the electromagnetic field. This fields are induced by different kinds of energies. One of these is omnipresent and all-permeating „Odic field" which, according to the late Wilhelm Reich, is the source of the omnipresent energy of the universe. He called the energy of this field „Orgone energy". The presence of orgone energy inside vacuum was proven with the help of blue light emitted by a tube from which air was withdrawn, under certain conditions. The omnipresent and all-permeating Odic field presupposes that intermediate degree of energy into matter, whose intermediate relation takes place on the subatomic, or plasma level.

VACUUM IS NOT AN EMPTY SPACE

Physicians have discovered the quality of vacuum:

The distinction between matter and empty space had to be abandoned when it was proven that virtual particles can spontaneously emerge from the emptiness and return to it, without the presence of any other particle of powerful interaction, which is demonstrated by the vacuum diagram. Vacuum is not empty, it contains an unlimited number of particles which endlessly emerge and disappear.

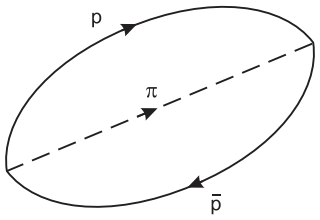

Figure 25. Vacuum diagram

The field exists everywhere and always, it is the carrier of all material appearances, and the existence and disappearance of particles are just forms of motion within that field of life.

THEOSOPHY AND OCCULT CHEMISTRY – VIRTUAL PARTICLES

„KOILON" – THE ATOM IN THE LIGHT OF THEOSOPHY

In the beginning, there was deep darkness.

The dark background of the ether space = protomatter (mula prakriti)

This is the basic substance in which Fohat is drilling holes.

And the Lord said: „Let there be light."

Holes in ether = protoether or the negation of matter – „koilon" – emptiness.

„Koilon" = colorless spiritual fluid which is omnipresent, infinitely dense, heavy, and elastic (the basis for the construction of the occult atom).

The occult atom – of a superphysical, seventh level; has bubbles filled with consciousness of logos arranged into spirals, which flow from the right to the left, or vice versa in the case of a negative atom. These white bubbles are lines of power, logos.

Anu: An occult seventh level atom displayed on Fig.26.

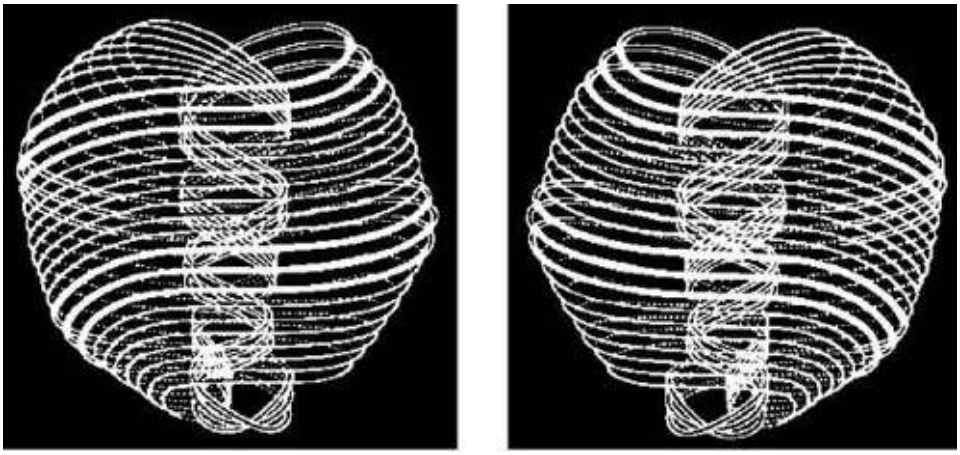

Figure 26. The appearance of a seventh level atom

It is a live, powerfully beating heart, revolving around its axis, and its axis represents a circle – just like a spinning top. It has three trunks and seven thin coils, each of which consists of seven groups of spirals, and the living heart represents an energy transformer. This is how the occult atom, from which everything begins and in which everything ends, is described in theosophy.

Inside the three strongest coils, currents of different electricities are flowing, and the remaining seven coils vibrate with different kinds of ether waves: with sound, light, warmth etc. – they display the seven colors of the spectrum, sound seven tones of the scale, and react to other physical vibrations and stimulations in different ways.

THE PHYSICAL UNIVERSE IS ENERGY, AND MATTER IS CONDENSED ENERGY

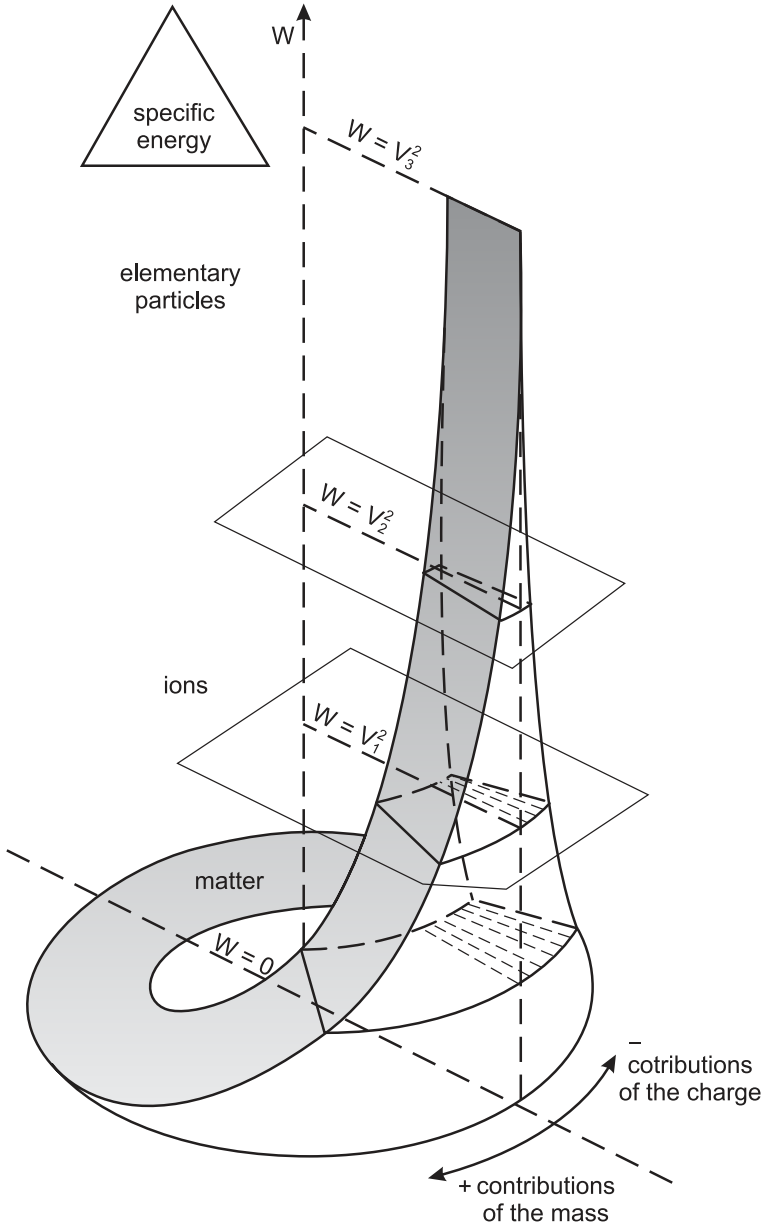

Figure 27. A mathematical-graphical presentation by the physicist Perme (from the book „Structure of nature“)

WILHELM REICH'S DISCOVERIES

„This cosmic OR energy permeates our whole universe... this energy is massless and it spontaneously pulsating" – Wilhelm Reich.

The fact that Dr. Wilhelm Reich (formally) discovered the energy of life around 1930 is hardly known. He called it – Orgone. Reich, who was born in Austria, graduated from the Vienna Medicine University in 1922, and then became one of the pioneers of psychoanalysis through his work with Sigmund Freud. Since he was opposed to fascism, he left Austria in 1939 and immigrated to the U.S.A., where he spent most of his time researching the orgone. Even back then, he started manufacturing orgone accumulators and „orgone guns", and climate modification devices, which he called „cloudbusters". Reich was convinced that the orgone can be used for various benevolent purposes. However, like many other scientists who were at the verge of the discovery and application of free energy, Reich was arrested by the American government, his laboratory and his books on the subject of orgone were burnt, data regarding his research was covered up, and he himself did not make it out of jail alive. He died in jail, allegedly of a heart attack.

We have already mentioned that this energy was also known to Nikola Tesla, as well as ways to produce and distribute this energy, which would ensure infinite amounts of energy for all of us, and free energy at that. On top of that, the planet would be much less polluted.

DIFFERENT NAMES FOR THIS KIND OF ENERGY:

Orgone, Prana, Chi, Akasha, Bioplasma, Biodynamic ether, Brahma, Dige, Mana, Manitu, Fluotoplasmic energy, Mungo, Bio-cosmic energy, Digin, Neutral force, Tachyon energy, Tondi, Vril, Scalar energy, Thelesma... or the energy of life, it is something that has always been present in the universe, in unlimited amounts, and known to some people since ancient times. It seems that the properties and potentials of this energetic force, which is still mysterious for most of us, are about to destroy postulations of our „consensus reality".

SOME OF THE POSTULATES OF QUANTUM PHYSICS

- Matter is not a fundamental physical postulate
- There are no two physical entities (mass – energy), something that is material and something that is immaterial.
- There is only one entity manifested in different ways, and it's „energy".
- Mass is not equivalent to energy. Mass is energy.
- The basics of electrotechnics clearly emphasize that the electromagnetic wave in a field of space has all the attributes of matter, even if it is not solid substance, it presupposes the intermediate degree of energy into matter.
- Mass, as a notion, is fiction. There is only charge.
- When we hold even the heaviest of objects in our hands, it is still just a sum of the electric charges of a substance, and these charges always interact with the fundamental sea of virtual particles and other energy fields on a subatomic level.

Inertia and weight are, according to the aforementioned interpretations, electromagnetic phenomena which arise out of the interaction with (tentatively said) empty space, which is actually a pot full of boiling energies on a subatomic level, and these are phenomena which occur in interaction with the zero-point field. According to mathematical calculations, the quantum world is a perfect hermetical world of pure potential, which becomes real and, in a way, less perfect when it is disturbed by an intruder.

The Russian scientist Konstantin Korotkov said that we are all woven into a network of omnipresent energy and omnipresent consciousness, in an omnipresent field of information, which we share with all living organisms, with which we can communicate in a certain energetic way, with people, animals, and plants, up close and across a distance. The reason behind this is the omnipresent and all-permeating energy of space, a massless energy (a recent expression for this is „Free energy"), which is created during clashes between virtual particles. We can safely assume that this gigantic source of energy or, tentatively, this complete emptiness in space, from which all matter is excepted, in a subatomic sense, is a veritable anthill of activity.

According to Einstein's equation, $E = mc^2$, in which energy is proportional to mass, the reason that all elementary particles mutually influence each other by exchanging energy with other quantum particles, which seemingly appear out of

nowhere, and then join and destroy each other over a time span of 10-23 seconds, causing energy fluctuation.

This is why we call these particles is virtual particles. The difference between them and real particles is mostly the fact that they only exist for a short moment, while the exchange lasts. These extremely short subatomic events, which happen all the time throughout the universe, accumulate into a gigantic energy which is, by the way, much bigger than all the energy gathered in all material objects in the universe. The zero-point field, as physicists use to call vacuum, due to the exchange of virtual particles, is always present as en energy field, because particles emerge and disappear in it, even at a temperature of absolute zero. Quantum fields in a quantum world are linked by a constant exchange of energy, which is constantly redistributed. According to that theory, real material particles represent only small energy vessels, which only appear for a short time, only to disappear in the fundamental basic field shortly after that.

- To illustrate this with something that is more comprehensible to us, we can describe swarms of light photons, which emerge from a stimulated filament lamp, disappearing on their way. We can see a constant illumination, because the emerged swarm of photons from the filament lamp is followed by subsequent billions of new photons, and the illumination lasts as long as the stimulated state of our filament lamp.

- We may feel free to think that the gigantic empty space around us is like a massive and all-permeating space scenery charged with energy.

- Mathematical calculations have proven that electrons revolving around their axis at a high speed, as well as around its atomic nucleus, are constantly losing energy, but they also replenish themselves with energy from the zero-point field, which helps them retain their orbitals. We are justified to assume that the same kind of thing is also happening in the macro-world, i.e. our Earth, which is revolving around its axis and around the Sun.

Also, with the help of the aforementioned example it could be argued that the zero-point field is the reason behind the stability of hydrogen atoms which, as a consequence, implies the stability of all matter.

- As a conclusion, the zero-point field is the fundamental state of the universe, and it constantly regenerates itself, retaining the stability of all matter in the universe.

When one or more exterior (valent) electrons are separated from the atom, we say that the atom became ionized. It emits a positive charge, and so it is called a positive ion. In another case, if an extra-electron is added to a neutral atom, it becomes a negative ion. Electrical forces between different ions are several times more powerful than any mechanical power, like the one created by gravity. Electric

plasma is a cloud of ions and electrons which can, stimulated by applied electric and magnetic fields, can sometimes be illuminated and behave anomalously. The most famous examples of electric plasma are neon signs, lightning, and the electric arc of welding devices. The Earth's ionosphere is an example of plasma which does not emit visible light. Plasma spreads through the space containing our solar system. The particle cloud of solar winds is made of plasma. The whole Milky Way is mostly made of plasma. Actually, 99% of the universe is plasma!

DEFINITION OF „FREE ENERGY"

Thus far, the best definition regarding zero-point energy was coined in 1988 by an electrotechnics engineer, Moray B. King, who said:

- Zero-point energy is a three-dimensional manifestation of the electric current from a physically real fourth dimension of space;
- This energy can intertwine with our three-dimensional space, causing changes in our spatial-temporal matrix;
- Zero-point energy can be used as a source of energy, where it locally changes gravity, inertia and the rhythm of time.

SOME PROPERTIES OF ORGONE

1. Orgone is massless, it has no inertia and no weight, which implies that it cannot be measured with conventional measurement devices.
2. It is omnipresent, but its concentration varies from spot to spot, and from moment to moment.
3. It is constantly moving. It moves irregularly from west to east, with a speed that is much faster than the speed of the Earth's rotation. From a constructed accumulator, this energy is transmitted as circular pulsating waves.
4. Orgone has an important property – it negates the law of entropy. It moves from lower to higher concentrations, as opposed to electric energy.
5. Orgone has the ability to create new matter. Under certain circumstances, various minerals are formed, which are still unknown, and they look like a white or green „powder".

6. Orgone can be accumulated and manipulated.
7. It comes from the Sun in huge amounts, and so its density is at its most during afternoon hours, and at its lowest between 3 and 4 AM.
8. Weather conditions, moisture, clouds, temperature, time of day, etc. can affect the amount and the process of accumulating orgone.
9. Orgone energy is moving in respect to an electric field, under right angles.
10. Water absorbs orgone. This is one of the reasons why water is used in energy cells.
11. Orgone energy has two polarities, and so we can have a positive and a negative orgone force.
12. Orgone energy can break through or move through all currently known materials, but at different speeds.
13. Orgone is slowly moving through conductors. It needs around 20 seconds to pass through a wire of a length of 50 meters.
14. Orgone has the tendency to move vertically upward.
15. By measuring, Albert Einstein determined that there is a two-degree difference between the interior of an orgone accumulator and the outside environment.
16. Its radiation belt is quite wide.
17. Orgone adheres to the laws of optics. A prism can deflect it under an angle, just like polished surfaces.
18. Orgone energy surrounds itself with alternating circular fields of opposing polarities.
19. Orgone is sensitive to living beings. It seems that the state of consciousness of a person who is experimenting with orgone, as well as his relationship with this energy, and with life in general, is very important!?! (It seems that this energy has its own consciousness and intelligence!?!)
20. Orgone can be concentrated to a certain point. When the orgone concentration reaches its maximum, orgone will start turning into electric energy, and find a way to discharge in such a state.
21. Torsion orgone fields transfer information without wasting energy, and they pass through physical media without any interaction with it.
22. Torsion orgone fields cannot be shielded with most materials, apart from synthetic polymer-based materials.
23. Every physical object, living or not, has its own characteristic torsion orgone field.

24. All permanent magnets have their own torsion orgone field, and this is why they can be used for therapeutic purposes.
25. The torsion orgone field can be created with the aid of geometrical distortion of physical vacuum.
26. Aluminum, like a mirror, can („optically“) deflect the torsion orgone field (reflection).

Orgone is normally flowing through people who are mentally healthy. It characterizes healthy sexuality, vitality, creativity, and dynamics. In our natural surroundings, ecosystems rich in orgone emanate life and abundance.

Physically, orgone is associated with negative ions, non-genotropic (self-organized) systems, areas of low atmospheric pressure, water vapor, and a blue ionic glow (heavenly blue).

One of the more important properties of orgone is its high affinity for water, which implies that water can both absorb and emit orgone. Another important characteristic is its tendency to move from a field of low concentration toward fields of high concentration.

Stagnant water and flowing water behave like a sponge or a condenser for orgone energy. They absorb lower orgone concentrations from objects or beings in their surroundings. If water comes into touch with an object which has a higher orgone concentration, it will „spill over“ its orgone energy into it.

Water with a turbulent motion, and spiral in particular, absorbs huge amounts of orgone due to nonlinear dynamic conditions which are created at that point. Because of this, it is called „living water“.

Another method of collecting orgone is using orgone accumulators. These can be boxes, covers or pillows made of alternative layers of, for example, steel wool or cotton. Such a configuration can produce or absorb orgone. However, when such an accumulator is satiated, or when its energy is exhausted, it cannot operate in an effective manner, until it is emptied or recharged, by putting it somewhere near water, in fresh air, or expose it to sunlight.

Orgone energy cannot be easily blocked with any kind of metal walls, plastic, or glass. However, some geometrical shapes, like cylinders, spheres, domes, or pyramids have the ability to accumulate, direct, or redirect orgone energy.

CHAPTER SIX

THE ENERGY OF AIR AND WATER

T. Henry Moray was born on 28 August 1894 in Lake City. He started experimenting with electricity when he was nine years old. Inspired by Tesla's works in which he describes Earth as floating in a gigantic sea of infinite energy that could be gathered and used, he started experimenting with high-voltage and high-frequency phenomena at the age of eleven.

He graduated from the Uppsala University in Sweden as an electrotechnics major. Upon his return to the U.S.A. in 1915, he worked for several companies. His experiments led to the development of the first semiconductor elements. One of the materials he used was galenite, and another was a powdery stone-like material, called Swedish stone, because it was used for road construction in Sweden. With a welding burner, he heated this powdery stone to obtain flinty earth. It was later determined that this was some kind of silicon dioxide.

Since 1921, Moray dedicated all his time to developing a device that would use emitted energy, and then, while using Swedish stone (silicone dioxide) and galenite as a „detector tubule", as a sort of electric valve, he managed to obtain 25 watt of electric energy through its small device.

Until 1925, he managed to increase the output energy of his device to 100 watt, and three years later it was increased to several kilowatts. In 1931, he applied for a patent for his emitted energy device, and for Moray's electric valve based on germanium, but this patent was declined for two reasons.

- The first reason was justified by the notion that the tubules of the electric valves could not have operated, because they had no cathode heating. It should be said that Moray's tubule was a then-unknown way of operation of a „cold-cathode" technology;

- The second reason was explained with the following words: „Such a device cannot work, because emitted energy does not exist" (from the book „The Scientist, the Madman, the Thief and their Lightbulb").

Moray used a detector tubule for his device, and this tubule worked like the earlier „valve". Furthermore, he used two oscillator tubes, two wire coils, several capacitors, and a high voltage transformer at the antenna, with the other side at the grounding.

His desire to bring the emitted energy for the whole world to use remained but an unfinished dream, because T. Henry Moray died in 1974.

"Ere many generations pass, our machinery will be driven by a power obtainable at any point in the universe. This idea is not novel... We find it in the delightful myth of Antheus, who derives power from the earth; we find it among the subtle speculations of one of your splendid mathematicians...Throughout space there is energy. Is this energy static or kinetic? If static our hopes are in vain; if kinetic – and this we know it is, for certain – then it is a mere question of time when men will succeed in attaching their machinery to the very wheelwork of nature."

Nikola Tesla, „Experiments with Alternate Currents of High Potential and High Frequency" (1904)

„I have harnessed the cosmic rays and caused them to operate a motive device"

Nikola Tesla, „The Brooklyn Eagle", 10 July 1931

TESLA'S DEVICE FOR THE USE OF ELECTRIC ENERGY FROM VACUUM

„Business stoplight" – an informative business monthly published an interesting text in its second issue of 2005, under the title „Nikola Tesla – the ingenious mind", from which we cite the most important part:

- „In 1931, Westinghouse Electric and Pierce Arrow Motor Car, led by Nikola Tesla, have manufactured a test car with an electric engine without batteries, absorbing energy from the ether. An electric motor with a power of 80 HP was built into the car, along with 12 vacuum tubes with electronic assemblies, wires, and resistors. The maximum speed achieved during a test run in Buffalo was 145 kilometers per hour. The car was noiseless."

- „Tesla commented that the driving force of such a car was the radiation which is readily available in unlimited amounts, coming from the ether that surrounds us. After that event, Tesla's free energy was never mentioned again, probably because it posed a threat for those industries that used energy as a payable service."

ORGONE ACCUMULATORS

While working in Norway in the 1930s, Wilhelm Reich, one of Freud's earliest associates, declared that he had discovered bions, fundamental particles of orgone energy, which is the basis for all manifestations of energy. Based on later research in the U.S.A., he claimed that this orgone energy permeates the whole universe, and that it can be concentrated with the help of devices that can be easily constructed. He called them orgone accumulators. These were cabins made of walls, inside which there were alternating layers of sheet iron and organic materials, mostly cotton and wool. The cabin had to be connected, with a metal tube, to a vessel containing five to ten liters of water. According to Reich, these accumulators accumulated free orgone energy from their surroundings. They were supposed to cure, and they reminded of a cabin, in which one could sit. After a person would spend some time inside this orgone energy accumulator, he/she would feel better. Inside and around them, people would feel some kind of sparkling, pains would ease, and the entire state would get better as far as health is concerned.

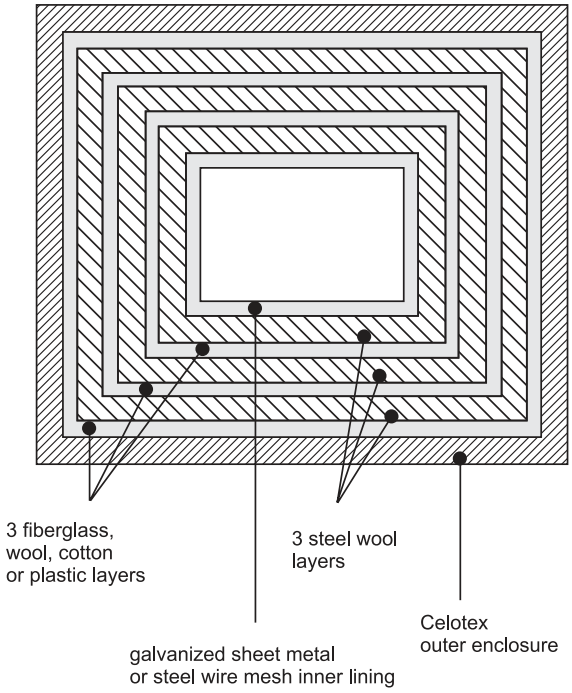

Figure 28. Simplified Diagram of the Orgone Energy Accumulator -from the book "The orgone accumulator handbook" by author James DeMeo, Ph.D.

Figure 28. displays an orgone accumulator, and the layers of walls of an orgone accumulator, reminiscent of a sandwich. These are actually materials, one of which has magnetic properties (sheet iron), while the layer between is wool and does not have magnetic properties. The principle is, actually, quite simple: by using alternative layers of materials with paramagnetic and diamagnetic properties, given the presence of water, it is possible to accumulate orgone energy. This was common knowledge among ancient civilizations, a long time before Wilhelm Reich, and this is why they were building their towers and pyramids in such a manner, by using materials with paramagnetic and diamagnetic properties, with the presence of surface or underground water.

THE EARTH AS A PLANETARY ORGONE ACCUMULATOR OF THE ENERGY OF LIFE

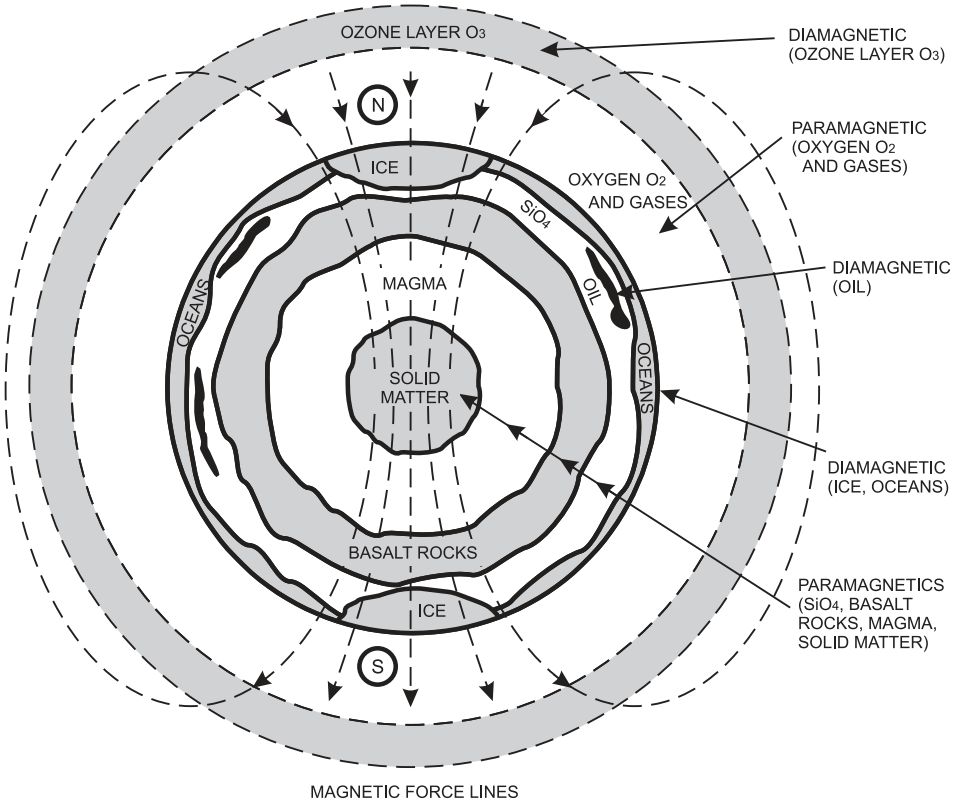

Figure 29. Planetary orgone accumulator

If we take a closer look at Figure 29, we can see that the first layer, the air between the Earth and the ionosphere, is diamagnetic (ozone O3). The oxygen and the gases are paramagnetic, followed by vast areas of water in oceans and ice at the poles, which are diamagnetic, as well as all the living beings and the vegetation of the Earth with its water content, which also have diamagnetic properties. Then, there's the Earth's sphere. The core contains around 30% of silicon, basalt rocks and magma, which are completely paramagnetic materials. Certain parts of the Earth's core contain diamagnetic oil and other substances of organic origin.

ORGONE GUNS

Orgone guns are devices that change the concentration of orgone in the atmosphere, because the powerful orgone field is always connected with negative ions and with dense concentrations of water vapor. With the change of the level of orgone, the distribution of condensed water vapor (i.e. clouds) is also changed. Orgone is considered to be a proto-meteorological substance, because it precedes all visible weather conditions.

ORGONE WATER GUN

To build this gun, it is necessary to acquire metal flue tubes used for furnaces, of a length between 1,5 and 3 meters.

It is necessary to build a chamber at the bottom, for which you could use a metallic „T-profile", which has to be installed at the bottom, and the sides should be closed with plastic covers. You need a water source in the vicinity, for example a tap and a hose for water supply, at the end of which there should be a sprinkler, whose task is to diffuse the water spray inside the chamber. Such plastic sprinklers are commonly used for gardening. The second hole in the chamber serves as drainage, to lead the water out of the chamber, i.e. to ensure a steady flow (Fig.30a).

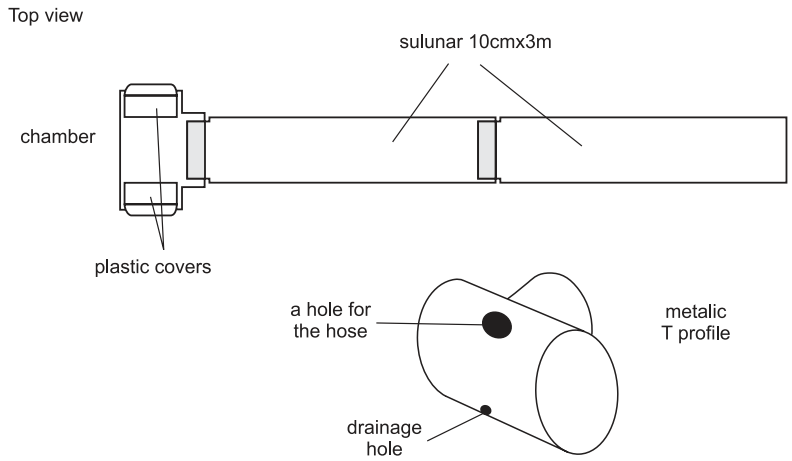

Figure 30. a) Orgone water gun

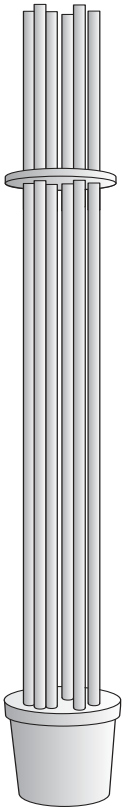
Even though this might look like science fiction to the „average“ person, it seems that these devices change the ratio of positive and negative energy in our environment.



Many among those who work with orgone claim that these devices stimulate the growth of garden plants, and they also have a positive effect on human health.

The practical effect of orgone guns is most obvious on the example of chemtrails.

Don Croft made a version of the gun (Fig. 30b) which allegedly provides great results. He claims that orgone guns in an airy environment work in the following manner: they absorb DOR and turn it into orgone energy. DOR is the negative type of orgone energy, created by its abuse, i.e. through exposure to detrimental influences; its concentration is very high around nuclear power plants, TV sets, radio and mobile telephony, and various industrial plants.

Figure 30. b) Orgone gun with crystals instead of water

This kind of gun does not need to be turned toward chemtrails or smog. It is enough to leave them in a vertical position, and they will clean an area with a diameter of around 70 kilometers. The fundamental feature at the foot of this gun are crystals.

There are several theories regarding what happens here and what kind of mechanism is used in this guns during the modification of weather conditions, which we won't elaborate right now.

There are small orgone generators, which are used to neutralize the so-called negative energy, i.e. DOR, and turn it into orgone. The SRB consist of five elongated quartz crystals of a length between 2 and 2.5 cm each, metal sawdust, and resin (Fig.31).

A model shaped like a dome or a pyramid is turned upside down. Some metal sawdust is poured into it, followed by some resin. One quartz crystal is vertically fixed into it (it stays vertically fixed, pointing at the top of the dome). The rest of the mould is then filled with metal sawdust, almost all the way to the top, and then with some more resin. Eventually, four quartz crystals are horizontally set (like the four quarters on a compass), and they are covered with resin.

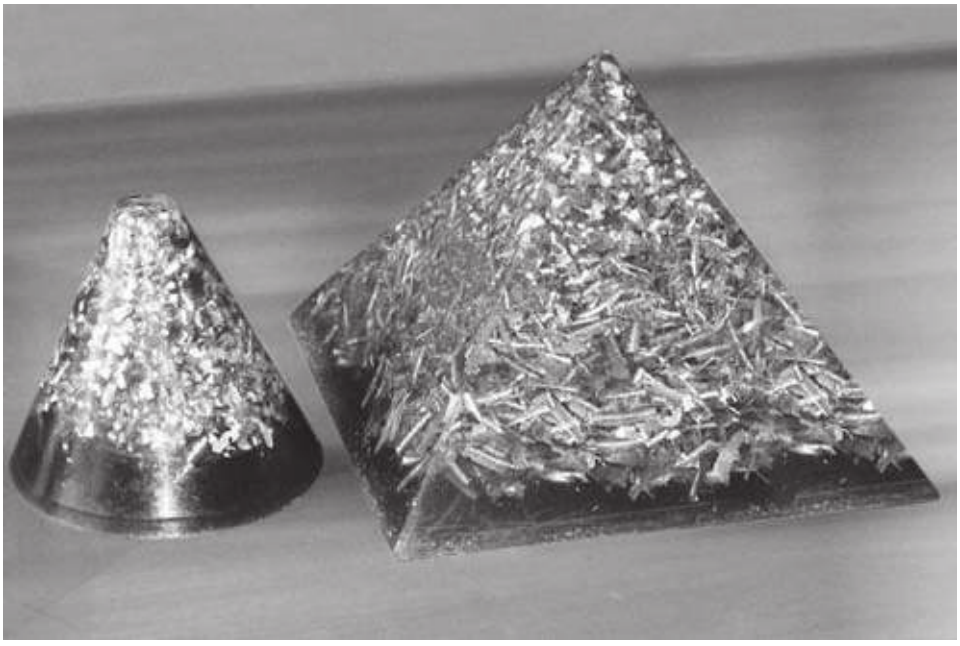


Figure 31.

Figure 32. Dr. Harry Oldfield holding „Big Bertha“ – a type of orgone gun, a huge electrode filled with citrine and clear quartz crystals in saline. He used this orgone gun for his weather experiments in Iceland.

According to the experiences of many people, orgone guns „clean“ the smog in polluted areas.

It is important to emphasize that Wilhelm Reich, in his time, claimed that UFOs become visible when they are in the orgone beam of these guns, which is also claimed by many people who use these devices in present times.

a)

b)

Figure 33. „Cleaning“ the sky with a common water-powered orgone gun

ORGONE BATTERIES

Theoretical artifact. Fiction or reality?

MARK I.

An Australian – let's call him Joe - has attempted to build a device in 1991 in order to decrease the fuel consumption of his car. He used a cylinder made of stainless steel, inside which there was another perforated cylindrical element. He closed the sides with covers, filled it with water and connected to a 12V accumulator.

He was naive enough to believe that there would be a water electrolysis which, in turn, would create water vapor. He connected the cell's outlet with a plastic tube to the car's carburetor. Through the side openings, he noticed that the cell was full of white bubbles and white vapor above the water surface.

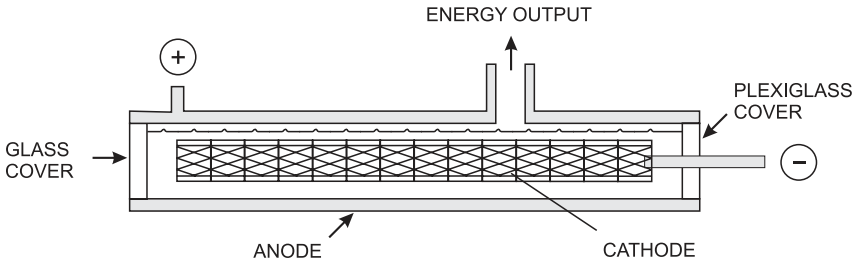

Figure 34. Illustration of the cell called MARK I.

He started the car engine and disconnected the fuel pipe, and the engine kept working even though it was no longer supplied with standard fuel.

It seems that Joe, by using his device, managed to hook up to an energy source that some call the zero-point energy, free energy, or orgone energy. While driving his car powered by the orgone cell, he noticed that the engine was constantly cool, as was the water cooler, and there were no gases passing through the exhaust.

CHAPTER SEVEN

WATER ISN'T JUST FOR DRINKING

If the chemical structure of water – two hydrogen atoms and one oxygen atoms – is considered to be trite by physicists, they are in awe of its physical, mechanical, and electric properties.

Water in percentage:

70% of the Earth's weight consists of water

93,6% of all water on Earth is salt water

6,4% of all water on Earth is fresh water

1% of the remaining reserves is potable water

Water constitutes:

70% of the body

85% of the blood

80% of the brain

70% of the muscles

10% of the teeth

CENTURIES-OLD SECRETS IN A DROP OF WATER

We know that two hydrogen atoms are linked to one oxygen atom in a molecule of water. The oxygen atom attracts the mutual electron pairs stronger than the hydrogen atoms do. Because of this, electron clouds are denser in the vicinity of oxygen atoms than in the vicinity of hydrogen atoms. A consequence of this is that positive and negative charges are never uniformly distributed across the whole molecule. The oxygen side of the molecule has more of a negative charge, while the hydrogen side has more of a positive charge.

In other words, such a molecule has a positive and a negative pole. It has polar characteristics. Molecules with such characteristics are called dipoles, thus we can consider the water molecule to consist of such molecules – dipoles.

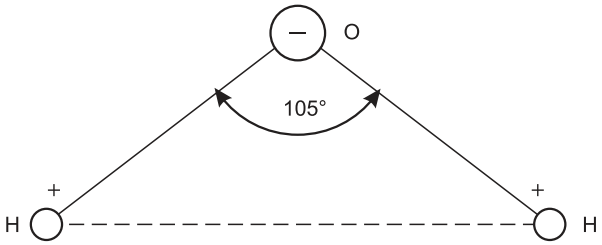

Figure 35. A water molecule

A water molecule is shaped like an isosceles triangle with an angle of 105 degrees between the sides. Water is an original environment, inside which life is developing. Likewise, our bodies mostly consist of water, and our body cells are awash in water of a salinity of 7 parts per thousand.

The properties of water are peculiar and mysterious, up to the point where every new bit of information about its behavior becomes significant for the history of science.

While researching water in its crystal form (Fig.36), similar to snowflakes, each of which has a unique shape (because there are no two that are alike), the Romanian scientific genius Henry Coanda discovered that there are tiny channels in the centers of flakes made of living water, that retain some water which is not frozen, and which is still flowing like sap inside plants, or blood inside animals.

At room temperatures and in thin layers, pure water is a colorless fluid. In thicker layers, it is bluish. It crystallizes into the shape of clearly defined crystals, which can only be distinguished with a microscope.

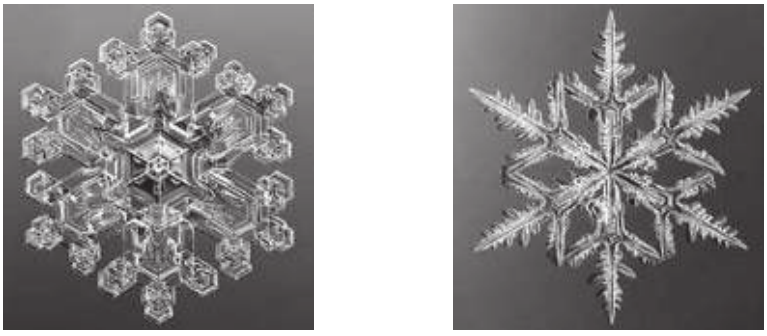

Figure 36. Crystal shapes of water

All these crystals have the shape of a star with six branches, but these branches are so different from each other, that no two similar branches can be found.

Coanda discovered that water, which creates longer-lasting new flakes, is the principal drink of people known for their longevity, not just the Hunza (at

the foot of the Himalayas), but also Georgians, Ecuadorians, Peruvians, and the people who live in the mountains at the border between Tibet and Mongolia.

Patrick Flanagan continued the research initiated by Coanda, by collecting water samples from all parts of the United States of America. Although water is considered to be merely a mixture of hydrogen and oxygen, it is anything but usual. It is the most important substance on the planet, and probably in the whole universe. Water contains 36 different isotopes, each of which has different properties.

According to Flanagan's interpretation, one of the most important properties of water is its surface tension, a power which makes things glue together, and form a sphere (a shape with the least surface to volume ratio), requiring the least amount of energy for its maintenance, simultaneously with an incredible potential strength.

Pauling, who won a Nobel Prize for chemistry, was the first to discover that the positive and negative tension of water do not cancel each other out but, rather, each molecule has two free poles. This bipolarity of the molecule is the reason why water molecules conjoin into groups.

The great scientist Bernal has proven that each five molecules of water connects into a pyramid, the base of which is a rectangle. A group formed this way, in a symmetrical row of five molecules, is a logical explanation for the fluidity of water.

Based on the aforementioned, it can be concluded that each five molecules of water connected into a pyramidal shape represent an orgone collecting lens, which confirms the proposition that the forces of the universe affect the life of all living organisms on Earth through water. In this matter, it is important to note that this pentagonal symmetry, which was known by the Pythagoreans, is the singularity of the symmetry of life. This is why their name for the number 5 was Pente Gamos.

The surface tension of water directly depends on the electric charge of the hydrogen atoms and the oxygen atoms. In a common water molecule straight from the tap (Fig.37), the surface tension is 75 din/c. The angle between two hydrogen atoms is around 105 degrees.

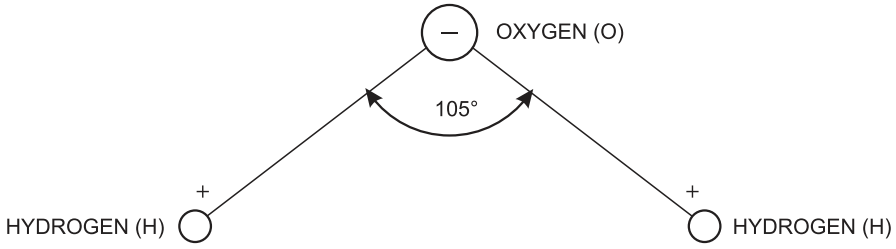

Figure 37. Water molecule with a surface tension of 75 din/cm^2

By changing the amount of the charge, living water can be created (Fig.38), which will have a surface tension of 65 to 68 din/cm^2, and the angle between two hydrogen atoms in the water molecule will be 120 degrees.

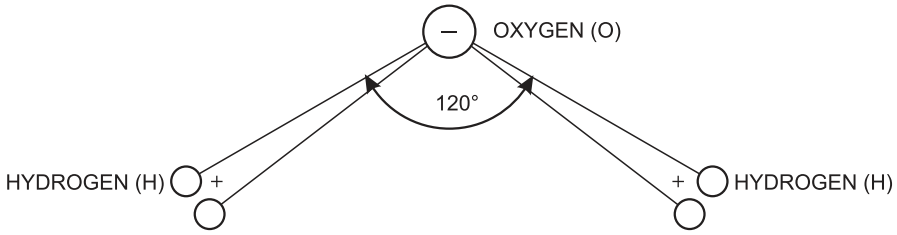

Figure 38. Living water molecule with a surface tension of 68 din/cm^2

The secret of the great sensitivity of water to cosmic forces is in its spin, says Flanagan. When water spins or swirls, its molecules separate in pairs through dissolution, releasing electric charges.

What happens is that hydrogen compounds of water molecules, which are exposed to that strain, extend like elastic bands, and this when they absorb planetary forces which, when the molecule returns to its shape (when the spin direction suddenly changes) remain captured and energize the molecule.

Tap water has a low count of fluid crystals and a very high count of random chaotic molecules. By cooling and freezing the water, more crystals are automatically created. Flanagan discovered that all crystals, like quartz or jewels, have a significant effect on the surface tension of water when they are immersed in it.

If we use water that was exposed to a crystal to water seeds, the sprouts will shoot more abundantly, and the grapes will be tastier than usual. Old Tibetan practitioners were aware of that, and they cured with the use of beverages made of water that was exposed to crystal. Flanagan believes that crystals obtain energy which influences the surface tension of water, because they act like resonators of the impulses of cosmic energy.

Research has demonstrated that common tap water has a surface tension of 75 din per square centimeter. The water of the Hunza, who live in a Tibetan valley and who are famous for their longevity, has a surface tension of 68 din/cm^2, as well as a negative charge known as the „zeta potential". Biopolarization and asymmetry give this water more ability to permanently integrate into all living matter, more so than any other matter can. Water is slowly adapting and submitting to all laws and physics and chemistry, and to all their reactions. Generally, it can be said that these cosmic forces reshape and change the pyramids of the pentahedron, according to which the molecular structure of water is built after Bernal, where five molecules of water constitute a pyramid.

This has an extraordinarily important implication with unforeseeable consequences – the forces of the galaxy affect all which is alive: humans, plants, and animals, and they do it through water. Regarding this discovery, it is obvious that water serves as a mediator between the forces of the galaxy and living substance, and by grouping into pentahedrons, it becomes sensitive to these influences, as well as able not just to enshrine the galaxy forces within itself, but also to transmit their power.

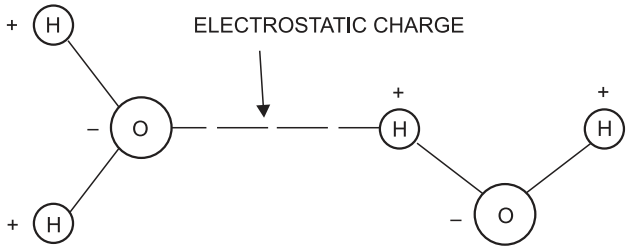

Figure 39. The compound of two water molecules

Let's just mention that no form of life known on Earth could exist without it. Since its significance is a consequence of its properties, its properties are a consequence of its structure, which is displayed on Fig.39.

HOMEOPATHY

Our body cells are made of various minerals in a colloid state which, according to the most recent analysis, are aggregates of atoms. Atoms are made of a nucleus charged with positive electricity around which, at various distances, electrons charged with negative electricity gravitate.

Everything that happens in our organisms is but an illustration on the principle of resonance, and this is especially true as far as the health of our organs is concerned. Our body is a gigantic aggregate, a resultant of various electromagnetic waves, which differ from each other by the number of extremely different vibrations and wavelengths that intertwine, combine and pass each other with the purpose of giving birth to other waves and vibrations of different substances, making up a balanced whole.

Isn't it the same thing that Hahnemann determined with his ingenious intuition by claiming: Matter is but illusion, force is matter. According to this, the group manifestation of man and matter, and matter and spirit in particular, is one boundless sea of vibrations at different frequencies. Until recently, the accepted notion was that only cosmic forces affect water. However, Piccardi has proven that water can be activated artificially, through electromagnetic waves.

Lorenzo's theory makes it possible to prove that each electron with an accelerating gravity emits a part of its energy as an electromagnetic wave. For the duration of this radiation, the electron is under the influence of a specific force. Of any outside cause starts affecting this electron, it will emit electromagnetic radiation under outside influence. This radiation has the same number over vibrations as the cause that initiated it from the outside. This way, it seems that the mechanism of the emission process was discovered, through which all changes of energy which appear between matter and radiation can be explained.

If we accept this explanation, the fact that there is an endless vibration in the universe soon follows. In accordance with this, it also follows that man and matter are also emitting cells of various waves.

WATER HAS A GOOD MEMORY

Still, it is unclear how highly diluted solutions can have such a striking effect on the body. One theory states that water „remembers" substances that were dissolved in it. Aided by quantum theory, some scientists attempted to prove that oxygen and hydrogen atoms in water can lead to a „memory" effect. However, this proof isn't conclusive. The homeopathy debate was lit anew by the research of Dr. Luis Rey. This Swiss researcher conducted research into highly diluted solutions with the help of termoluminescence, the light emitted by heated matter. He discovered that various solutions, including water in which some substance was dissolved, and which doesn't contain a single atom of the original substance after dilution, send various signals, which could be considered proof that water „remembers" whatever was diluted inside it.

THE HOLOGRAM PROVES THE TRUTH

Each particle of matter remembers and lives in the entirety of the Universe

A hologram is a halted light wave of an object recorded by a special technique on a photographic plate, which is illustrated in Fig.40 along with laser illumination. The film looks like a window through which an object is observed. By changing your position, you can see details which you haven't seen a moment before. Many scientists were dumbfounded by what was discovered by this recording method. When you cut a photographic plate with a recorded object, or break it into pieces, any piece of that plate will carry the image of the complete recorded object when

illuminated by a laser light. The only difference is that this image will be somewhat pale, depending into how many pieces you have cut or broken the plate. This is demonstrated in Fig. 40.

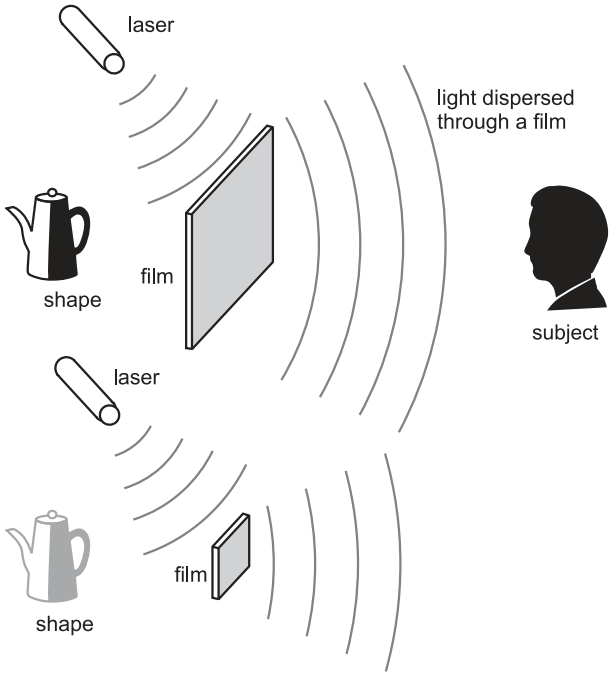

Figure 40. Physical matter remembers

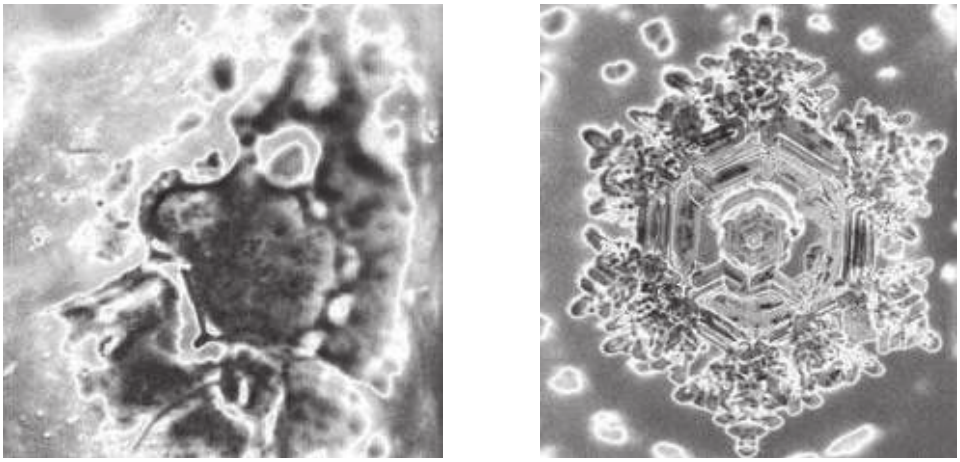
What does it prove? Each piece of the hologram, even the tiniest one, has the information on the whole object, in the form of a code. In other words, each particle of matter in the physical world has the information on the whole. It vibrates and lives in the entirety of the universe. This discovery is absolutely fascinating.

WHEN WATER STARTS TO SPEAK...

The Japanese practitioner of alternative medicine, Masaru Emoto, is taking photos of frozen water crystals with a special technique, and it seems that these crystals speak volumes more than it could have been anticipated.

It is obvious that water is an outstanding energy absorber, which receives biophotonic emission of the living orgone energy through its hydrogen and oxygen atoms, manifesting it in the diversity of its crystal shapes and chaos.

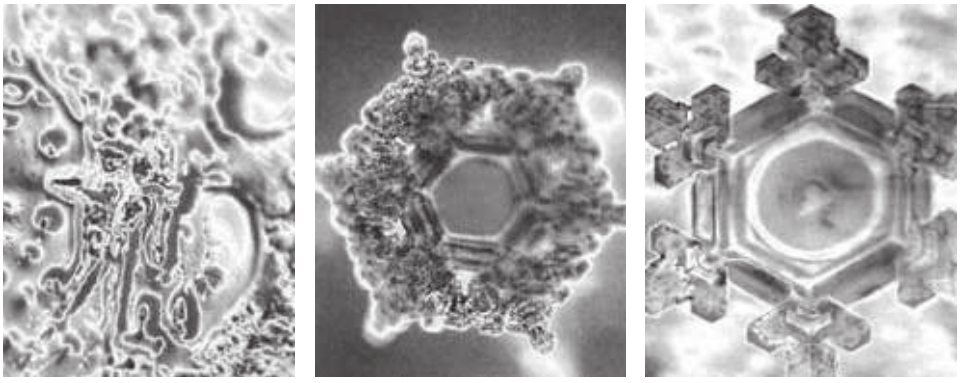
Fig.41 documents a sample of water from the Fujiwara dam in Japan. In Fig.41 a, the structure is dark and shapeless. After taking that photo, a priest prayed over that sample of water. The new sample was frozen and photographed. The change was unbelievable – there was a clear, white hexagonal crystal within the crystal now (Fig.41 b).



a) b)

Figure 41. The effect of prayer on a sample of water from a lake

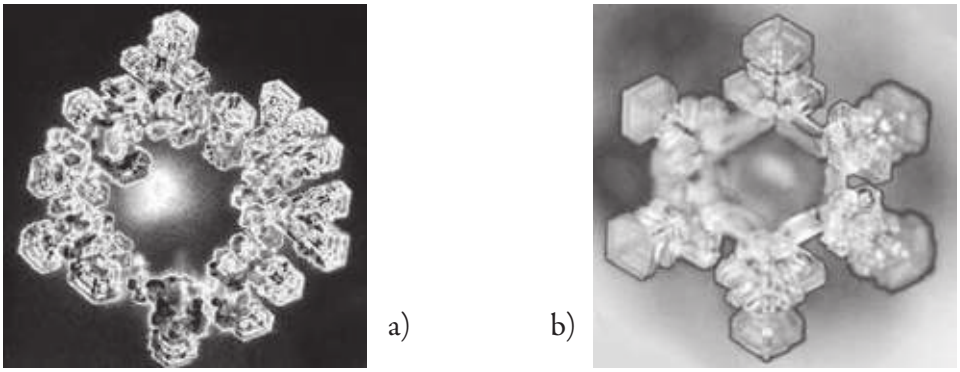
Negative words and emotions do not create a crystal structure, but chaotic, disjointed samples (Fig.42 a). By speaking the words „thank you“ (Fig.42 b) or „love and respect“ (Fig.42 c), wonderful and orderly crystals appear.



a) b) c)

Figure 42. The effect of spoken words on water samples

Water from the famous Lourdes sanctuary, usually associated with miraculous properties, creates a unique crystal (Fig.43 a).



a) b)

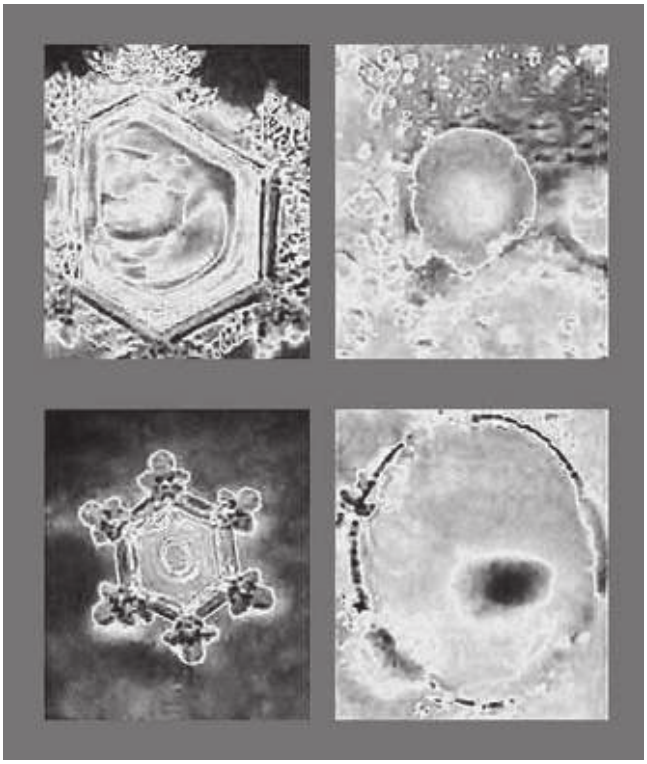
Figure 43. Influence of natural fields and singing on water

This is what the wonderful Christmas song „Silent night, holy night" looks like when transformed into an ice crystal (Fig.43 b).

HOW CELLULAR PHONE FREQUENCIES AFFECT WATER

Dr. Gerald Hyland, a British physicist, determined that cell phones would „never get an approval" if they were a type of food. The discoveries of Dr. Hyland were published in the medical journal „The Lancet", and they reflect the growing concern regarding the effect of cellular phone frequencies on the brain. One of the issues he is worried about is that the use of cell phones can be linked to aggressive behavior in children, but the problem goes much deeper. A study by the Spanish Institute for neurodiagnostic research demonstrated that a two-minute conversation can open the „blood-brain barrier" and enable the toxins in the blood stream to kill brain cells. Even such a short conversation disrupts the electric activity of the child's brain for around an hour. „This can cause psychiatric and behavioral problems, and aggravated learning", claims the Spanish study. The Swedish University hospital „Lund" has confirmed these discoveries and published the fact that the radiation emitted by mobile stations and transmitters can destroy cells in parts of the brain that are responsible for memory, motion and studying.

Japanese scientist Masaru Emoto has exposed water to electromagnetic waves of a cellular phone, and the effect can be seen by comparing Figures 44 a) and b). The effect of the cell phone has destroyed water crystals, and this is what these phones and transmitters are doing to us, as can be seen on Fig.44 b).

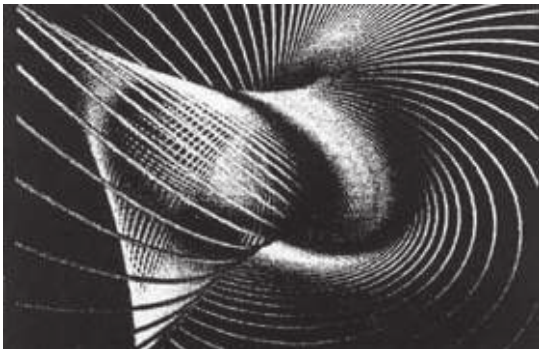


a) b)

Figure 44. Through the impact of cellular phone frequencies, the crystal structure of the water turns into a state of chaos

BOOK TWO

NOTHING IS IMPOSSIBLE



CHAPTER EIGHT

EVEN GOOD CAN BECOME EVIL

Nikola Tesla has experimented with scalar waves, i.e. with the scalar energetic field. This type of waves, which are not well enough known, are not Hertz waves, because their behavior is of a different nature.

With scalar waves, the gravitational constant must be added. Scalar or electromagnetical-gravitational wave do not exclusively travel through our time and space, they travel through 3 dimensions + space, and hyperspace with four spatial dimensions had to be introduced because of this.

In their diffusion, no material barriers can change their course or stop them, not even conductive metal screens and boxes, a Faraday cage, or any other type of material. In this regard, only specially shaped regular geometrical bodies are an exception – upright cones and pyramids made of dielectric material – which, under certain conditions of exposition, attract them, break and focus them along the segments of their vertical axis determined by the centers of the input and described sphere. These regular polyhedrons, depending on their proportions, embody a certain refractive hyperindex for scalar waves, and they represent passive scalar devices. It is an area studied by many researchers of the „field of pyramids".

Einstein's theory of relativity is now becoming just a part of a new theory of „superrelativity".

Tesla was creating scalar waves with his high-voltage and high-frequency impulse transformers, to which he added gravitation through a heavy metallic rotating disk, and a regulatory coil wound around a permanent magnet. It was easy to control and adjust, as far as the adjustment of the initial amplitude was concerned; this way, singularity was created, in place of the earthly tellurian radiation, energy was drawn from it (Fig.45).

Tesla claimed that light, sound, and electric anomalies that take place during earthquakes are of a scalar nature, just like anomalies happenning in areas of great tectonic faults.

motor

Figure 45. Magnetic resonator

Tesla claimed that scalar waves can cause changes in the course of time.

- Since the human brain can produce these waves, there is the possibility of understanding all paranormal phenomenons, like levitation, remote communication, radionics, dowsing and others.

- We can assume that some ancient civilizations have been using these remote communication possibilities with the help of telepathic messages of scalar waves of the brain, adding gravitational components to their thoughts and and spoken messages, while meditating, turning heavy prayer wheels, as well as those small spinning tops, the way Tibetan monks still do today as a part of their prayers.

- Today we know that we can produce scalar waves with the Hieronymus machine. When this machine is working, common instruments and detectors don't detect a thing, but people who are present feel very uncomfortable, with headaches, nausea, and very unpleasant vibrations inside the body, along with the appearance of obvious nervous disorders.

In 1900, after basic research of this transformer's operation, Tesla partly revealed the scary mystery of his discoveries. The electromagnetic waves he produced were not Hertz waves. They are impulse type waves, which can affect the course of time, as well as all other energy fields, including gravity. They affect the bodily inertia, the brain and the thoughts. Tesla scalar waves have no mass

and do not adhere to Einstein's formula $E=mc^2$. Generation of the scalars and the impulse characteristics are shown on Fig.46.

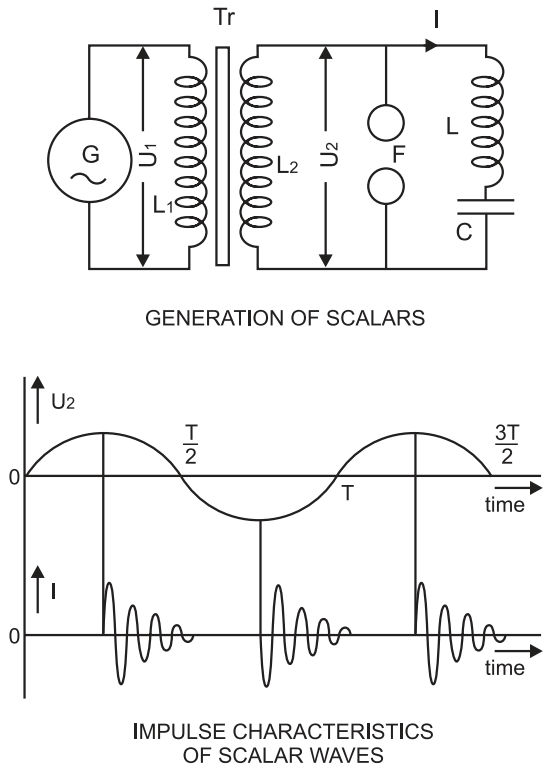

Figure 46. The appearance and operation of a scalar generator

THE DEVELOPMENT OF TECHNOLOGIES WITH ADVERSE EFFECTS

Pyramids and the motion of a sunflower's flower inside them,
- testify about the turning point in armament („Riders of the apocalypse")

CHRONOLOGY OF EVENTS:

In 1899, Tesla built a device called the „magnifying transmitter". This is a special type of high voltage transformer, which produces electromagnetic

impulse waves. The diameter of this transformer was 16 meters, and it was able to produce ten million volts, which it emitted into the atmosphere through an elevated metallic sphere (Fig.47).

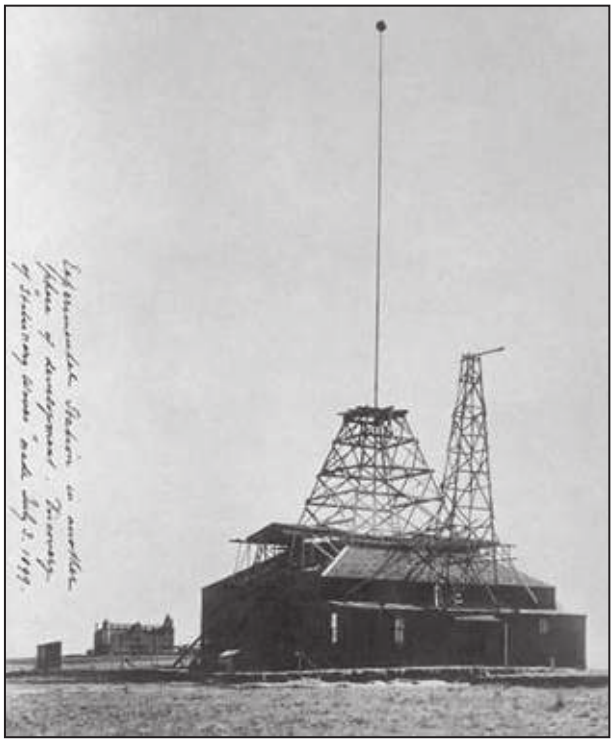

Figure 47. Frontal view of the Colorado Springs laboratory

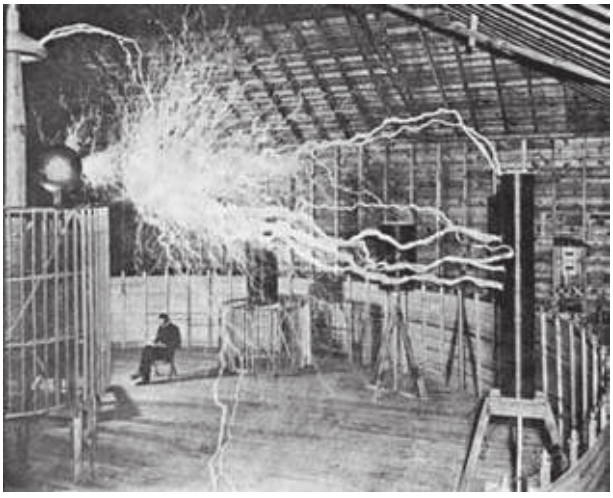

Figure 48. Nikola Tesla in his laboratory

As early as 1900, Nikola Tesla warned that the operation of his MAGNIFYING TRANSMITTER causes the coupling of atmospheric nytrogene and oxygen, as well as other undesirable compunds and side effects. He said: „I was afraid I would set the whole atmosphere on fire."

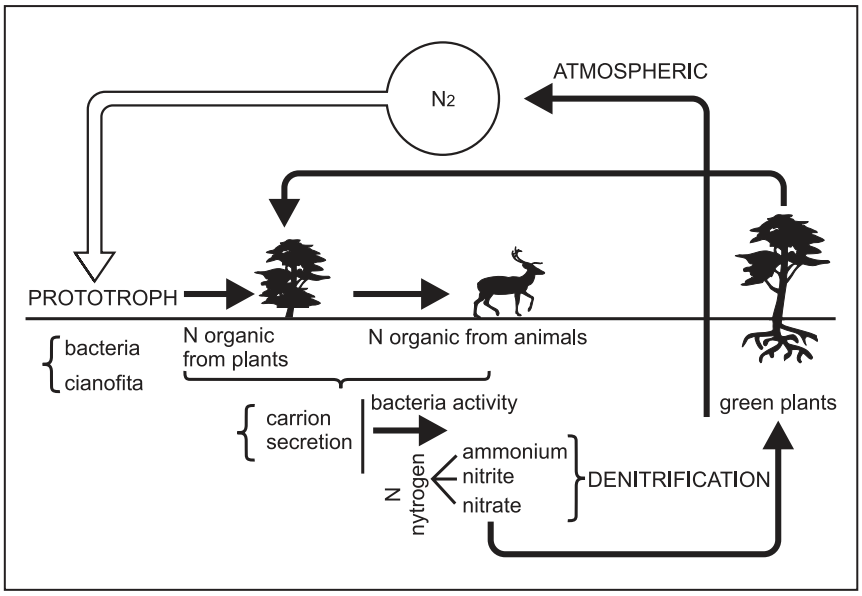

Figure 49. The nytrogen cycle in nature

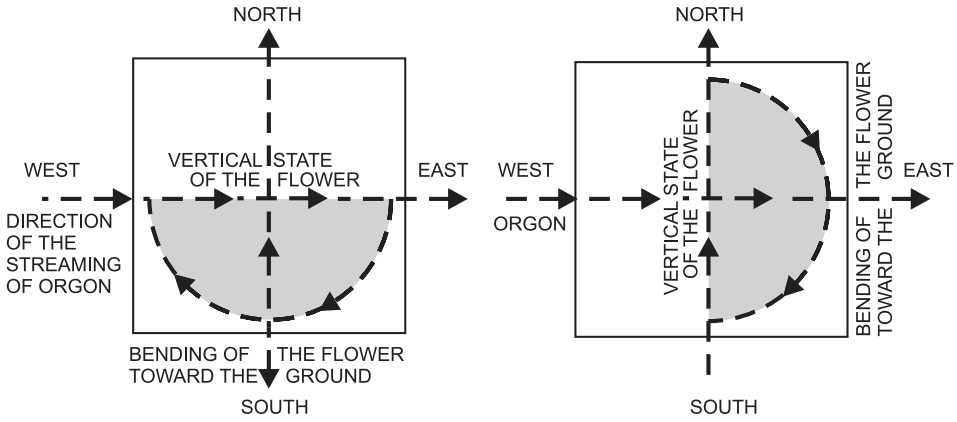
The use of high power plasmic weapons based on Tesla scalar waves can create other negative compunds of atmospheric elements, apart from the loss of nytrogen, which is an element indispensable for life.

A deficit of pure nytrogen in the atmosphere decreases the growth of Papilionaceae in the soil, which live as a mycelium in tree roots and feed nytrogen compounds to the tree, which is one of the fundamental reasons behind the decreased growth of forests. Acid rains, climate disturbances, cyclones, ozone holes – all of these probably have the same source, the „riders of the apocalypse" who are taking their toll.

∗ In 1974, a group of scientists, who were researching the behavior of plants inside pyramids, noted that something surprising happened. Until two years back, the motion of the sunflower's flower was recorded with a camera, and it rhythmycally moved in a semicircle each two hours, in an east-west direction. Then, in 1974, it inexplicably changed direction and started moving in a semicircle, but in a north-south direction, which it is still doing today. Why?



a) Orgone cycle – until 1974 b) Magnetic cycle – since 1974

Figure 50. Motion of the sunflower plant inside the pyramid

One cycle of semicircular motion takes exactly two hours and keeps repeating for 24 hours (12 times a day)

a) The plant in the pyramid has a divergence that is greatest in the west-east direction

b) The plant in the pyramid has a divergence that is greatest in the direction of the flow of the magnetic field, south-north

orgone motion cycles	magnetic motion cycles

∗ Between 1974 and 1979, 250 square kilometers of ice in the Antarctic caved in, and another 25,525 square kilometers until 1989. The question is whether experiments and the effect of plasmic weapons has contributed to the melting of icebergs.

Figure 51. Ice melting in the Antarctic

* Between 1975 and 1983, the magnetic south pole moved for 100 kilometers to the northeast, which was determined by the survey of a Soviet expedition.

This finding was confirmed by a Canadian expedition in the Arctic in 1985. According to most recent surveys, the magnetic north pole of the Earth is located around 1500 kilometers to the south from the geographic north pole. The polar explorer James Clark Ross has determined the location of the magnetic north pole in 1831, but back then it was a further 600 kilometers to the south from its current location.

The power of the Earth's magnetic pole was first measured by Carl Friedrich Gauss in 1832. These days, its power is constantly under observation, surveyed by the ship „Glomar Challenger" and the „Magsat" satellite.

Surveys of the Earth magnetic field's power demonstrate that it is constantly decreasing. In Minneapolis in 1984, geophysicists Subir Banerjee and Donald Sprowl from the Minnesota University, have discovered that the power of the Earth's magnetic field has halved over the last 4,000 years. They determined this by researching the settling of layers in North American lakes.

* In 1975, during the SALT negotiations with the U.S.A., the Soviet Union demanded to halt the further development of terrifying weapons, of a kind that the average person cannot even imagine. These facts indicate that both countries have already manufactured and tested plasmic weapons based on Tesla scalar waves. This, in turn, hints at the possibility that there were great changes in energy and gravitational relations in fateful 1974, and this was the origin of the great powers' fear of building further weapons that can destroy the whole planet and exterminate life.

* In 1976, radio and radar systems arounf the world were disturbed by a completely new type of interference called „Woodpecker". There were media reports that their source is located in Riga, in the Soviet Union. Gigantic „standing waves" of a length of 1600 km pulsated between 4 and 24 times a second.

* In 1977, meteorologists reported a strange „block" which stopped the normal circulation of meteorological phenomenons along the west and east coast of the U.S.A., as well as the Soviet-Polish border, all the way to Finland, which was caused by strong „standing waves". While these magnetic waves lasted, weather almost got „crazy". Snow fell in Florida, and floods wreaked havoc on Europe. At the same time, the American submarine and satellite tracking system failed, and two American satellites were damaged using the „electron beam" technology.

Images were published in media and magazines:

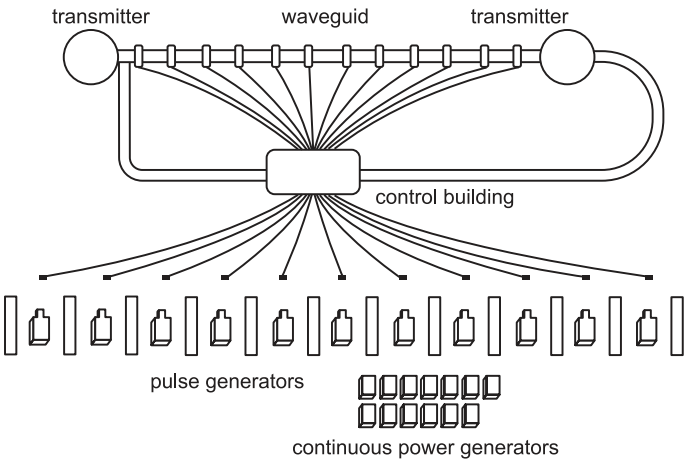


Figure 52. Sketch of the Soviet „Woodpecker“ generator

∗ In 1977, Canadian independent researcher Andrew Mishrowski, who was leader of the Planetary associations for clean energy, claims that the Soviet Tesla transmitter affects our behavior, and our brain, since they have the same frequency range. He claims that there is protection against these frequency interferences, which is already used by many governments. It is the „Vitaset“ device that emits 7,8 changes a second, which is the resonant frequency of the Earth, thus bringing the effect of the incoming Tesla „Woodpecker“ signals to a halt.

∗ In 1978, the atmosphere of the East coast was occasionally shaken by powerful explosions, which came from above the Atlantic. Supposedly, it was a powerful Tesla transmitter, forming incoherent signals into coherent, on a certain point in the Atlantic, which is why these explosions were heard. This system was called „termal bomb“. At that time, Canadian miners were complaining about strong headaches.

∗ In 1979, satellite „Vela“ registered the operation of a Tesla pulsar in the southwest of Africa, and then again in 1980, when a gravity disturbance was recorded at the location of energy explosions. How many years before these discoveries were the experiments with the Tesla pulsar performed?

∗ In 1980, an American military magazine published an article on eight pages about psychotronic warfare, which is confirmed by lieutenant colonel L. B. Alexander, a science doctor who graduated from three universities. In his explanation, he claims that such systems have already been demonstrated, and results were achieved, especially in suggesting a certain kind of thought sent through special transmissions, by subliminal messages and direct mental suggestions. In the Afghan war in 1980, Tesla's fireballs were used, according to the article published by eyewitness Nick Douani, a war reporter, who said: „These fireballs can destroy the enemy's weapons, or just the electronics.“

There is a justified assumption that, along with hothouse gasses, experiments with high power plasmic weapons have also contributed to the ozone holes.

It is obvious that the atmosphere of the whole world is disturbed, that icebergs and glaciers are melting, cyclone and hurricane winds emerge where they never did before, and seasons no longer adhere to their established calender dates.

– If we were to judge by the aforementioned event descriptions from the media and from other sources, we could assume that the horrifying power of plasmic weapons has demonstrated its scary force. The magnetic-gravity axis is disrupted, the stability of spatial and temporal relations is shaken, the Earth's ozone shield is damaged and perforated, and the amount of the living orgone energy in the air is aberrational, all of which are horrible issues. This is the kind of secret power and force of scalars, which Nikola Tesla was warning us about in the year 1900.

– Long before us, ancient civilizations have recognized the force and power of scalar waves, and the omnipresent and all-permeating energy of space. They were draining this energy in a natural way, they generated it in spheres, towers and pyramids, they produced orgone energy, which is useful and required for life, for the general welfare, in accordance with the omnipresent and all-permeating energies of heaven and Earth, without harmful consequences for life on our planet.

THE MAYA PEOPLE AND THE PYRAMIDS

1600 years ago, the Maya people were growing different fruit in the same field at the same time. This means that they had permaculture before Cortez' arrival.

The Maya people used a weed and insect control method aided by small pyramids, with the radionics system.

They were catching cosmic forces with small pyramids, which they used to place in their fields, on nodes of the lines of earthly tellurian currents. They would put burnt seeds of undesirable weed or insects into the pyramid when the corresponding planets would reach the height of their activity – this radionics effect would be transfered to the fertile fields by radiation, and weeds and insects would be removed from them.

They also placed smaller pyramids within larger ones, in order to increase their efficiency. They stored their seeds and harvested fruit in hollow pyramidal structures buried in the soil, their tops pointing down, made of raw brick. They covered them with leaves and clay, preserving them from deterioration and decay, using them until the next harvest.

CHAPTER NINE

HARMONY OF HEAVEN AND EARTH

The experiments conducted inside the pyramids indicate the following:

– The pyramids collect and direct the energy of space („free energy“);

– The pyramids also work as energy generators;

– Pyramids intensify crystallization;

– They increase dehydration up to 60% and perform mumification;

– They prevent mildew and putrefaction;

– Food and drink becomes tastier;

– Razor blades sharpen themselves;

– Water evaporates 15% faster in a pyramid;

– Using water from a pyramid for washing the skin makes the skin soft and flexible;

– Water from a pyramid tastes better than common water;

– An avocado fruit watered with water from a pyramid grew roots after four weeks, and grew into a 20 cm tree after another 15 days, while the other avocado fruit, which was watered with common water, did not grow any roots even after a few months.

– Plants watered with water from a pyramid grow faster and they are more fertile

– Flowers have more blossoms and less diseases

– In the book „Magnetizing water systems“ published in Moscow in 1982, it is mentioned that water, which was flowing through a magnetic field at right angles to force lines, had properties that were reminiscent of water kept in a pyramid. This realization supports the claim that permanent magnets have their own orgone field, and answers the question about what is flowing through magnetic force lines.

– French researcher M. Violet made one liter of chemically pure water by burnung hydrogen in oxygen atmosphere. Into this water, he immersed a tadpole (young of a frog), which momentarily became motionless and immediately died. He poured that water into a closed container, sealed it and left it on his balcony for a week, exposed to the influence of the Sun and the stars. After that, he immersed another tadpole into the water, which normally lived inside it and normally developed.

– Chemically pure water is dead water. If this water is exposed to the Sun's radiation for some time, by which it is nourished, or if it is stored in a pyramid for a while, it becomes living water that supports life.

– If living water is heated to a temperature exceeding 60 degrees Celsius, or if it is brought into a prolonged contact with a metal, it becomes dead water.

– Pyramids make the water more vital, and more valuable in an energetic sense, for all living organisms.

– Experiments with planted plants stored in pyramids demonstrate an accelerated growth and quicker ripening.

– The same result is achieved by watering them with water from a pyramid.

– The growth of trees, plants and grain on the Earth's surface is connected to star cycles and Sun cycles, which has been researched by the famous astronomer William Herschel, who claimed that everything grows better during maximum solar activity.

– Dr. Harold Saxton Burr determined that crops fail (accounting for years of famine) during solar activty known as „Sun spots".

– A sunflower in a pyramid has a semicircular motion, and it bends towards the floor of the pyramid in regular cycles of two hours each.

– When an aluminium curtain is placed inside a pyramid, only the part of the plant that is higher than this aluminium curtain is moving.

– When a powerful permanent magnet is placed into a pyramid, plants stop moving in most cases.

– Gold foil placed in a pyramid attracts the plants, which lean towards the foil, eventually entangling it completely.

– All plants perceive the energy of the pyramid and, when they are outside the pyramid, they lean towards the pyramid during their growth process.

– An experiment was made with a climbing plant, which has the ability to find each favorable protrusion in the wall, or a nail driven into a wall, and tie itself to these objects with its flexible outgrowths:

The climbing plants were placed into a chamber, and a nail was driven into a wall close to the plant. To the east, a small pyramid was placed, with a height of only three centimeters. The plant neglected the nail and turned toward the pyramid, completely entangling it after only a few hours.

Regardless of how many nails were driven into walls next to the plants, the plants would always turn toward the pyramid and entangle it, as the energy of the pyramid was the most attractive one as far as plants were concerned.

– Through measurements, it was determined that the brain waves of a person sleeping inside a wooden pyramid are completely different from the brain waves of those who slept outside the pyramid.

– An experiment with a golden Syrian hamster, who had a small pyramid inside its cage, demonstrated that the hamster always built his nest next to the pyramid, and the hamster has also done this after the pyramid was removed from the cage, dragging the nest toward the place where the pyramid used to be, as if some kind of energy footprint was still present.

– Galen Hieronymus, the designer of a scalar wave production device, was cultivating plants in a completely darkened room, with no sunlight whatsoever. One of the plants, which had a metal plate placed above itself, and the metal plate was connected with a metal wire to another metal plate at the roof of the house, was growing in a normal fashion, as if it was growing outside the house, although it had no access to sunlight. All the other plants died. Hieronymus believed that the biophoton quantums of the orgone energy of life, which came from the roof of the house into the dark cellar through a metal conductor, enabled the plant to live, and it survived without any visible sunlight, but with the help of this biophoton emission.

– An experiment with a chilli pepper has shown the following:

– A chilli pepper placed into a pyramid along the north–south axis over a period of twenty days remains green and dry.

– A chilli pepper placed into a pyramid along the east–west axis over the same period of time gains a red color and ripens.

– When we bend the chilli pepper at a right angle, with one end along the north-south axis and the other along the east-west axis, the end which has north-south direction remains green, while the east-west end becomes ripe and red.

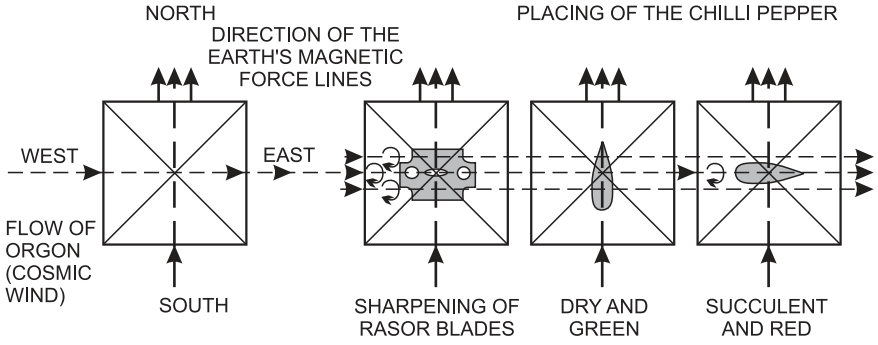

Figure 53. Illustration of the pyramid experiments

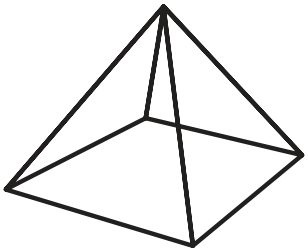
Experimental reactions of the chilli peppers can be observed from two aspects: a) natural magnetic fields, direction: south-north
b) orgone direction: west-east

– It was experimentally proven that the effects we shall obtain in pyramids will depend on the size of the pyramids and the materials used in their construction, but we shall have no effects whatsoever if we build the pyramid from aluminium or a mirror.

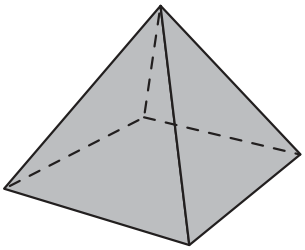
– An experiment with a glass of water containing decaying fish has shown that the water completely cleared and cleaned itself after twenty days in a pyramid, and the decaying fish settled at the bottom. The water had no smell and it could have been used for drinking.

EXPERIMENTS PERFORMED WITH VARIOUS PYRAMID MODELS

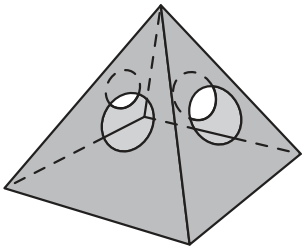
Figure 54. Models of pyramids with explanations



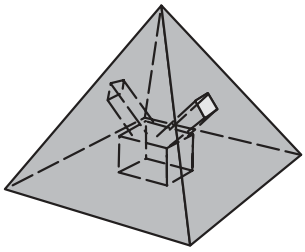
Number 1 represents a pyramid made of copper, containing only edges and corresponding angles, and no surfaces.



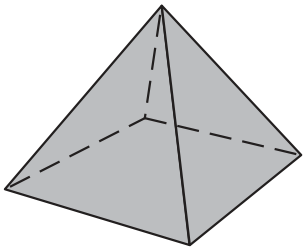
Number 2 represents a model made of paper, containing all surfaces.



Number 3 is a paper model with all surfaces, and somewhat large circular openings on each surface.



Number 4 is a full pyramid, cast in silica sand, with a hollow chamber in its center, from which there are two chimney-shaped cavities leading towards two lateral surfaces.



Number 5 represent the model of a pyramid cut from a mirror and containing all the surfaces or, in another case, thin and highly polished aluminium sheet.

To a higher or lower degree, all these small models have retained their mumification and dehydration properties, as well as changes in the surface tension of water. This is true for all pyramids, even for number 1, the only exception being number 5. It is obvious that mirrors and polished aluminium disrupt some ebergy flows, or simply reflect them, thus obstructing the system operation. While experimenting with these models, downscaled models of the same dimensions as Khufu's pyramid were used, and they were placed with their base in a north-south and east-west direction. Other materials, such as plywood and hardboard, provide decent results as well.

FUNDAMENTAL SPECIFIC QUALITIES OF SOME OF THE GREAT PYRAMIDS

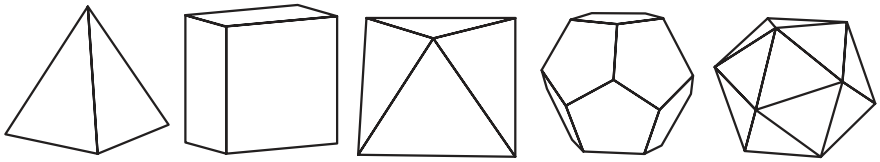
1. Shape of the pyramid (steplike – smooth);
2. Types of material used in their construction;
3. The existence of chambers in the interiors of the pyramids;
4. The existence of a chamber below the pyramid;
5. The presence of surface flowing water in the vicinity;
6. The presence of underground water below the pyramids;
7. The presence of man-made moist underground canals connecting the pyramids;
8. The grouping of several pyramids in the same area, by size;
9. The presence of a large fertile valley in the vicinity of the pyramids;
10. Pyramids were most frequently built on elevations and mountains, if this was possible;
11. The four lateral surfaces and the base of each pyramid were set in an east-west-north-south direction;
12. Pyramids usually have openings or chimneys. These are inclined tunnels which lead from the interior chambers towards the surface, and they are pointed at the starry sky.
13. Pyramids and other orgone-energy buildings; churches, mosques, and other sacred objects are usually built in places where the tellurian currents of the Earth intersect, on energy points of the Earth, places with strong earthly powers.

ANSWERS TO POSTULATIONS REGARDING THE SPECIFIC QUALITIES OF PYRAMIDS

Ad.1. When we talk about the pyramid, the per-nether, as a building representing a house of energy, it is perfectly clear that the pyramid shape was chosen for a reason.

The five platonic bodies: figure 55. a), b), c), d), and e).

In all of them, the edges, angles and surfaces are equal. Shapes with 4, 6, 8, 10, 12 and 20 surfaces. Incursions of two or more bodies with four surfaces. There are five – and no more than five – solid three-dimensional bodies, the edges, angles and surfaces or which are equal.



a) b) c) d) e)

Figure 55. Five platonic bodies.

a) the three-sided pyramid (tetrahedron), with four sides
b) the cube (hexahedron), with six sides
c) an eight-sided body (a double four-sided pyramid) (octahedron)
d) a twelve-sided body (dodecahedron)
e) a body with twenty sides (icosahedron)

All five bodies, regardless of how different they may be, can be developed from one body, the tetrahedron, i.e. the three-sided pyramid.

Ad.2. We can see that the pyramid shape is one of the fundamental body shapes. Let's recall that the silica crystal, from a molecular point of view, is a three-sided pyramid (SiO_4), and that the Earth is made of approximately 30% thereof. Let us also recall that each five molecules of water always combine into the shape of a four-sided oyramid, and that the water inside rocks, which is in a liquid state, accounts for approximately 70% of the planet's weight, along with various admixtures. We know that paramagnetic materials, limestone, sandstone, basalt, diorite, granite, and flintstone were used in the construction of pyramids.

All these materials are rich in silica, and they are ideal for the reception of high-frequency cosmic energy, that they are ideal oscillators and resonators, which can be induced electrically, thermically, and sonorously, i.e. through pressure oscillation (the piezo effect). Another vernacular name for mica is also „cat gold", becaise it glows in the sun, due to its silica crystals.

Pyramid-shaped construction was chosen for the accumulation of orgone energy because, optically, the pyramid is a lens, or an eyeglass for scalar waves, whose focus is located at one third of the pyramids height, in its interior. Because of this, most pyramids were built as orgone accumulators, from layers of paramagnetic and diamagnetic materials, in order to improve the absorption of orgone energy from the surrounding space.

Ad.3. The pyramid focus can be easily explained on a small paper model of a pyramid. On each lateral surface, we draw a vertical line from each angle to the middle of the opposite side. This way, we get a central point at the intersection of the vertical lines on each side of any lateral surface of a pyramid. We drive a piece of wire into this point, and we direct it toward the lower angle of the opposite surface of the pyramid.

After we drive all four wires through lateral surfaces, they will be touching each other in the very focus of this eyeglass of ours, this lens of the scalars.

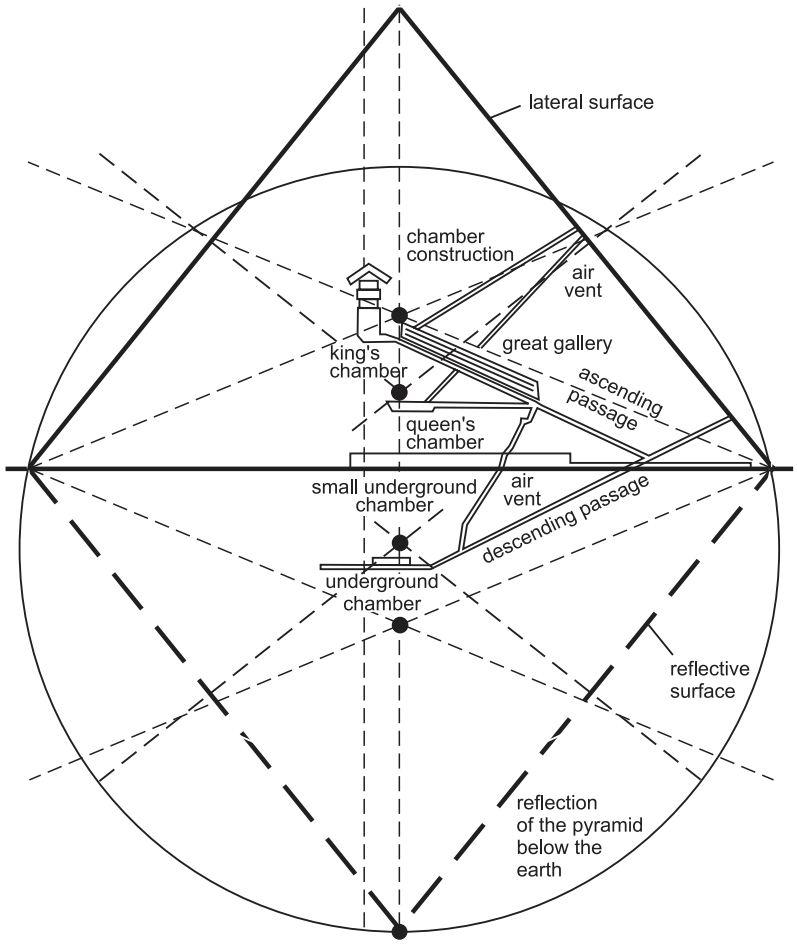


Figure 56. Focus points of Khufu's pyramid

Ad.4. If we would drive our wires into the pyramid in a different way, vertically into the lateral surface of each side of our pyramid, the spot were all the wires touch would be somewhat lower. This is another important junction and focus, a resonant spot inside the pyramid.

If we imagine that our pyramid has a reflective shadow inside the Earth, below its base, and if we would draw vertical lines to the imaginary lateral surfaces, we would find the lower focus and the lower resonant point (Figure 56.). These are the three places where – in some pyramids – the chambers are located, for apparently incidental reasons. These are the rooms from which slanted cavities exit towards the lateral surfaces, i.e. tunnels from which stars in the sky can be seen.

Ad.5. Why is flowing water above the surface important?

Ad.6. Why is an undergroung water current important?

We know that water is the source of all life, and a very specific medium. Water absorbs orgone energy (the omnipresent energy of space), but water has many additional abilities, and it is an emitter of orgone, which always flows from a lower concentration to a higher concentration upon encountering it. Water has the ability to convert moleculary incoherent waves that enter it into moleculary coherent waves. Water memorizes and oscillates, depending on the type of energy stimulating it. Neutrinos stimulate water into infrasonic oscillations.

Now, it's time for another, and probably most important secret of water. Perhaps you have seen a trout, that pretty fish commonly encountered in brooks and creeks, simply standing still in the middle of a rapid, even if one would expect the water to carry the trout away, or at least to see the trout swimming and struggling to stay in place. However, the trout remains motionless. It stands still without as much as moving its fins.

You see, you were not the only one to notice it. Viktor Schauberger, who loved nature and performed surveys and experiments to clarify this issue, determined that this phenomenon is caused by the temperature difference between the fish and the water, a total of 4 degrees Celsius, which he called the „water anomaly point". This is the difference of 4 degrees Celsius where all forces that act inside water are nullified, creating perfect harmony and balance. These four degrees in temperature difference make this natural wonder visible and observable.

It is believable to say that our ancestors and the builders of the pyramids knew about this specific property of water. They were using aboveground water currents to transport warm orgone, and they called this water, which was filled with the power of the sun, „male water", as opposed to the underground water, which they called „female", carrying cold orgone. It was hardly a problem to achieve a temperature difference of four degrees Celsius. Underground water

below the pyramids was probably the medium which performed the coherent stabilization of the waves of this massive oscillator, simultaneously providing it with huge amounts of orgone energy, which it carries within itself. It is also an infrasonic oscillator, induced by neutrinos from deep within the Earth, carrying these oscillations through the pyramid and into its resonant chambers.

Ad.7. Wherever there are pyramids – and they are everywhere – there are always many kilometers of moist underground tunnels. It is not easy to understand why our ancestors invested so much time and effort to connect the pyramids with all this long underground tunnels. I believe they would also wonder why we have digged hundreds of kilometers below the earth in search of coal. They needed energy, just like we need energy. We use thermoelectric power plants to produce energy with the help of coal, which we later use, for example, to provide heating for small and large polythene greenhouses, where we grow flowers, vegetables, and fruit.

Our ancestors were directly using the omnipresent energy of space (the orgone) and provided it to a whole area of fertile fields and valleys.

We constantly have to dig and drill new tunnels in order to produce all the required new energy, and they simply did it once and for all. The question is – whose system of obtaining energy is the more functional one?

- Let us return to the tunnels which were interconnected below the ground, and which somehow connected all the pyramids in a given area, often passing below rivers that were flowing aboveground.

It is a well-known fact that there are two types of orgone – the surface orgone, warm and with a positive charge, as well as cold orgone, with a negative charge, and which can be found in its natural surroundings in moist caves, as well as all these manmade moist tunnels. Based on the aforementioned, we can conclude that the difference between these two types of orgone is their electric polarity and their temperature and moisture, which reminds us of those four degrees Celsius of difference in water temperature, while the moist air is full of water in the form of condensed steam. Pyramids are interconnected with underground tunnels, because these tunnels contain an enormous amount of cold orgone, which is required for their functionality.

Ad.8. Per-nether, the energy of the pyramid, has never been found by itself anywhere in the world, the basic reason for this being that orgone moves from a place of lower concentration to a place of higher concentration, and so a larger number of pyramids enabled a bigger amount of energy, i.e. orgone or, as we have already explained, a bigger amount of living energy for people, animals, and plants. This is the reason for the difference in size and height between pyramids, from the smaller ones, to the bigger and taller ones.

It is easy to understand why the pyramids were built in a succession, which has the shape of a Fibonacci spiral. This is the shape of a harmonious flow of the living energy of space, from the shape of the galactic movement of planets to the shape of a snail shell on the mainland, as well as the shell of the snail on the seafloor, or the spiral motion of the energy of life inside living beings and the „qi" energy. This is confirmed by a knowledge of the sequence and the respect for basic cosmic laws of the currents of life.

Ad.9. Pyramids were always built in the vicinity of huge and fertile lowlands, because they were built for the purpose of providing these fertile lowlands with the cosmic energy of stars, and the orgone energy of life, thus providing both for people, animals, and plants.

Ad.10. Why were the pyramids mainly built on elevated terrain, or on top of hills and mountains? At the beginning of this book, magnetic and electric components above the ground were described which, in common surveys, show that the voltage component increases for around 100 volt for each meter of height, and that magnetic equipotentials become severely dense at the top of tall objects. This data implies that voltage and magnetic pressure will take place at protruding tall and pointed objects. If the object is tall enough, there will be impulse smoldering ionic discharges, which wa the reason behind the construction of pyramids on elevated ground.

High voltages which can be found between the inner layer of the ionosphere and the Earth, amounting to 400,000 volt, shall certainly break through the sluice-gate of the air through impulses, as is the case with any capacitor, and it will happen on pikes, at these tops of pyramids, towers and domes, when the charge exceeds the breakout point. The negative charge of the earth is at its highest in these places, and it is also at its most dense in the top of a pyramid. After breaking out, it takes a certain period of time before a sufficient density of charge accumulates at the top of the pyramid again, and then another ionic outburst between the earth and the ionosphere follows.

The impulse high voltage ionic outburst, along with some other energies and the presence of the gravity force that our Earth has in the spatial field, will induce Tesla scalar waves, which is perfectly logical.

Scalar waves breaking out at the top of the pyramid stimulate the virtual particles of our omnipresent energy field to collide and to fluctuate energy, thus creating a fresh amount of orgone in such a simple way. It should be said that small local gravitational stresses (microquakes) also occur during this process, and they can also be measured with sensitive instruments. These small stresses, which shake the pyramid, are not the cause, but rather the consequence of energy events during interval scalar and orgone discharges.

Ad.11. Setting the pyramids into a precise position according to the quarters also has its logical explanation. It is known that orgone streams around the Earth from the west to the east, somewhat faster than the rotation of the Earth around its own axis, and some researchers call it the cosmic wind. Another known fact is that each permanent magnet has its own orgone field, and our Earth is also a gigantic magnet. We are also aware of the fact that during each flow of a current through a conductor or through conductive media at an angle of ninety degrees, induces a magnetic field. Due to this fundamental reason, the pyramid is set in such a fashion that the natural orgone streaming on the surface, in a west-east direction, has a north-south streaming of the magnetic field force lines at an angle of ninety degrees.

Ad.12. Openings and chambers in pyramids

Resonant chambers in pyramids have an energetic contact with the starry skies through the slanted channels (chimneys) which are pointed at the stars, which in turn provides them with the electric, magnetic, sonic and gravitational forces of the stars, in order to achieve a harmonious resonance with them (see Fig. 57.).

Figure 57. Resonant chambers and chimneys inside pyramids

When some of these pyramids contain these slanted, sloped channels, they are invariably directed toward the most brilliant and largest planets in the starry sky, i.e. planets that have the greatest mass, as well as the greatest gravity.

The energies of stars, with its electric, sonic, and gravitational forces, along with the energies of neutrinos coming from the Earth, collectively stimulate the chambers toward a natural resonance. Since each planet in the sky has its own sound, which we cannot hear, there will also be sonic oscillations inside the chamber, which means that the whole functioning system of the per-nether is slowly encircled. These energetic supports in the starry sky - these energy levers – imply that our ancestors knew that nothing in this world could work separately,

and that the whole universe is but a single body, one spirit and one soul, and one gigantic energetic scenery inside which we are all mutually connected with each other, as well as with the entire vibrations of the universe. Both from the stars and from the inside of the Earth, a huge amount of neutrinos is reaching the pyramids.

Ad.13. In order to achieve singularity with the Earth, and in order to achieve the optimal vertical energy streaming of the Earth – sphere energy, the best position for each energy building, like the pyramids, as well as all sacral objects, was by ancient architects decided to be the intersection of earthly radiation. They knew that when the energy singularity is achieved, energy will flow through the object from the Earth's zero point toward the ionosphere, an energy that has a beneficial effect on each living organism which, of course, includes humans, their minds and bodies, if this energy streaming of life between Earth and sky is balanced, and if the harmony between energy and space is achieved.

WHICH ENERGY FIELDS AND NATURAL FORCES WERE USED FOR FUNCTIONAL EFFECTS IN PYRAMIDS

1. Energy fields of object radiation were used;
2. The energetic abilities of crystals were used;
3. Great masses and gravitational fields of the Earth and the stars;
4. The magnetic fields of the Earth and the Sun were used;
5. Microwave electromagnetic fields of the stars were used;
6. Natural orgone currents in a west-east direction were used;
7. Orgone energies accumulated in underground water currents, caves and moist tunnels were used;
8. The natural electropotential charge between the Earth and the ionosphere was used;
9. The increased density of the magnetic field's force lines was used, as well as the increased ionic charge at the top of the pyramid;
10. Energetic fields of earthly tellurian radiation was used in order to achieve singularity;
11. The omnipresent energy of space was used – „free energy";
12. Energies of neutrinos and anti-neutrinos were used, which are created during the beta decomposition of the cores of radioactive materials inside the Earth, as well as those coming from the stars, from space;

13. Sonic and infrasonic resonant effectives were used;
14. Biophotonic emissions and scalar waves were used;

According to the aforementioned description of the energies that were used, it can be determined that all the available energies of the universe, as well as those of the planet Earth were used in the achievement of the functional requirements of the pyramids. Both those energies that are known to us, and those that are not; those that can be measured, and those that can't; those which possess mass, and massless ones.

Neutrino and biophotonic emissions were used, all available electromagnetic and ionic fields, scalar and gravitational waves, sonic and crystal resonances, and electropotential differences in voltage relations between the Earth and its ionosphere.

Pyramids are generators of the energy of life, built in a way as to be beneficial to mankind, while at the same time not disrupting the ancient harmony between the sky and Earth.

Over thousands of years in the past, but particularly during the last century, many negative energy changes happened in our environment.

1. The electric and chemical pollution of air, water and earth has significantly increased;
2. The electric conductivity of air has changed;
3. The Earth's magnetic field is constantly weakening;
4. The protective ozone layer encompassing the Earth was punctured and damaged in several places;
5. The air currents between the upper and lower layers of the atmosphere, which always used to be stable, have been disrupted;
6. The relations between air, sea and earth have been changed in regard to warmth;
7. Due to the destruction of forests, which are the lungs of this planet, the amount of oxygen in the air is constantly decreasing.

The pyramids are precisely built energetic objects, which have perfectly functioned and repaired disrupted energy relations for as long as there was a harmonious relation between the sky and Earth.

Sadly, civilization processes in our past, but particularly in present times, have disrupted this harmony to such a point that we can feel safe to claim that the survival of all living species on Earth is severely endangered.

All instrumental measurements and energy recordings up to this point, which were conducted with special instruments and cameras, show that the great pyramids still work and emit the orgone energy of life, even if only to a lesser degree.

THE PYRAMID AS AN ORGONE BATTERY

Orgone is separating from water and moist underground chambers and tunnels because it has the tendency to stream from a lower energy level to a higher one, much unlike electric currents. Water and water steam in underground currents and tunnels shall release the accumulated orgone for yet another reason, this being the electropotential difference between the inner and outer charge of the pyramid. The pyramids have a powerful negative charge in their respective interiors, as opposed to the great positive charge which can be found on their outside and at the very top of the pyramid. Orgone is associated with negative ions.

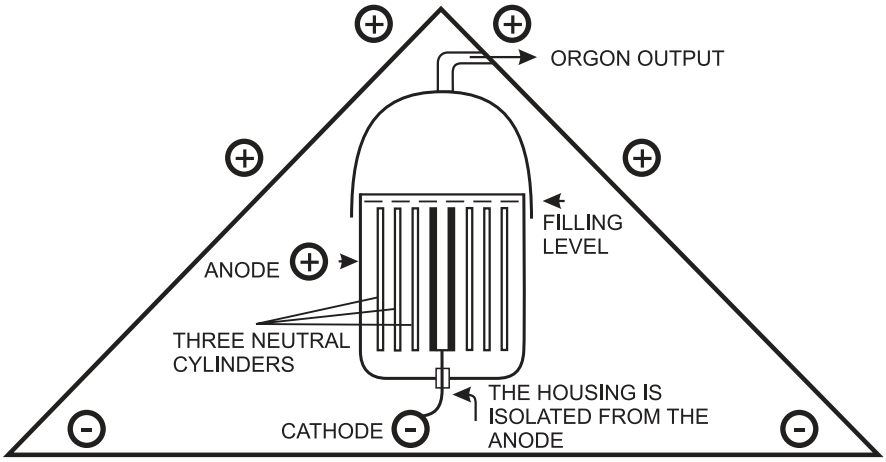

Figure 58. Pyramid-shaped orgone battery

Figure 58. displays a simplified illustration of a pyramid as an orgone battery, with the use of water, the minus of the Earth and the plus of the sphere, which works according to the fundamental principle of a joecell battery.

- All the orgone batteries that were manufactured up to this point use this simple principle. When there is water (any form thereof) somewhere in the object's interior, and the object has a sufficiently large electropotential difference, minus polarity on the inside, and plus polarity on the outside, orgone will start flowing towards the surface of the object, or through a slanted tunnel (chimney) and curl into the air space.

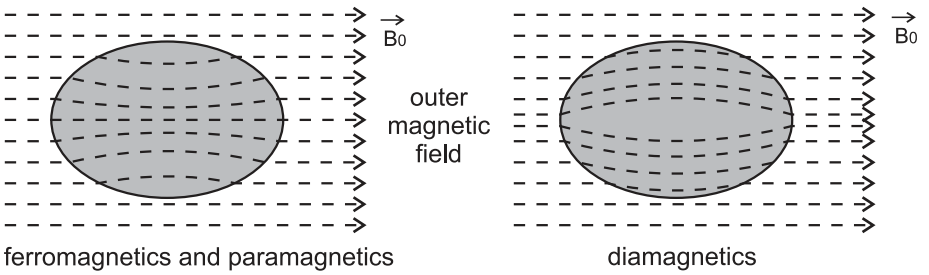
- With these explanations, we are often oblivious to the fact that there is a large amount of water in the compounds in all the construction materials, including those the oyramids were made of. Also, we often forget that there is lots of water in the moist air inside the underground tunnels and air chambers.

MAGNETISM IN SUBSTANCES

All substances in a magnet field are magnetized, and their own magnetic fields form within them. Because of this, they can both increase or decrease the strength of the outer field (see Figures 59 and 60).

PARAMAGNETICS	DIAMAGNETICS
	Induced magnetic dipoles of a paramagnetic substance are directed in the direction of force lines of the outer magnetic field.	Induced magnetic dipoles of a diamagnetic substance are directed opposed to the direction of force lines of the outer magnetic field.

Figure 59. How substances affect magnetic flows



they increase the strength of the outer magnetic field, attracting the magnet	they decrease the strength of the outer magnetic field, attracting the magnet

Figure 60. Behavior of paramagnetics and diamagnetics in a magnetic field

Diamagnetics are applied in last generation trains, which levitate in a magnetic field during motion.

Ancient civilizations were quite familiar with this phenomenon, which they often used while building objects of vital importance. Obelisks, pyramids and sacral objects were made of paramagnetic substances. Volcano rocks and stones are particularly strong paramagnetics, while water, along with the entire flora and fauna of the Earth, is diamagnetic.

Magnetic susceptibility chart for some elements and anorganic compounds

Name	Formula	$\chi m/10^{-6}\ cm^3\ mol^{-1}$
Oxygen	O_2	+3449 P
Nitrogen	N_2	-12 D
Hydrogen	H_2	-4 D
Water	H_2O	-13 D
Iron oxyde	FeO	+7200 P
Carbon dyoxide	CO_2	-21 D
Aluminium oxyde	Al_2O_3	-37 D
Gold	Au	-28 D
Silver	Ag	-19 D
Copper	Cu	-5 D

ENERGETIC EXPLANATIONS OF YIN AND YANG

The circulation of the QI energy, which represents the vital energy of life, takes 24 hours to complete one circular flow through the entire body, which is depicted by the yin and yang symbols.

YIN	YANG
female	male
polarization ⊖	polarization ⊕
diamagnetic	paramagnetic
attracts magnet	repulses magnet
cold	hot
static	dynamic
inner	outer
descending	ascending
closed	open
organic	anorganic
down	up
front	back
hypofunction	hyperfunction
depression	excitation

The symbol of YIN and YANG originated from a mathematical-geometrical image of a circle of circles.

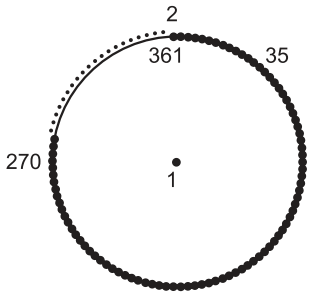


Figure 61. The center of a circle with 360 quantitative characteristics on a circle as a basic distinctness of the measure of the QI entity

For explanations and depictions of the origins of the YIN-YANG symbol, as well as the drawings and terms of the behavior of QI energy in space in time, we have used materials from the book „QI inženjering“ („QI engineering“, Beograd 1984) by Dr. Đuro Koruga.

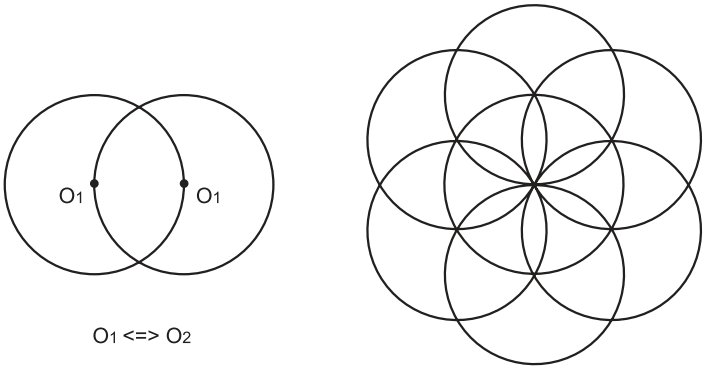

Figure 62. The circle of circles as a realized law of the inner – outer in the case of the QI entity

These wonderful drawings and mathematical postulations demonstrate the entire beauty and simplicity of the expression of the energy of life.

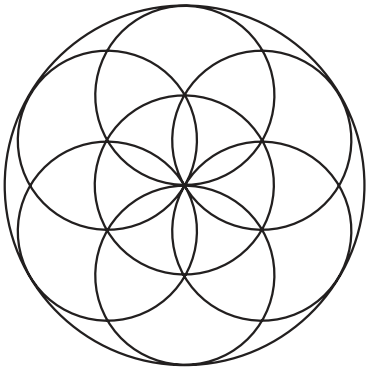

Figure 63. Meraido – the realized law of the circle of circles as a measure of the relation between the inner and the outer as determined by symmetry

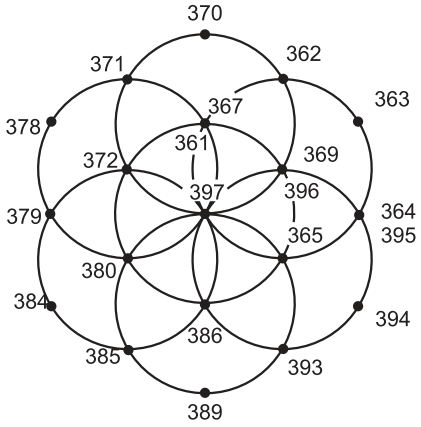

Figure 64. The distinctness of the QI entity with 397 quantitative characteristics as an outer realized law of the circle of circles

Symbolism of the inner – outer, male and female QI.

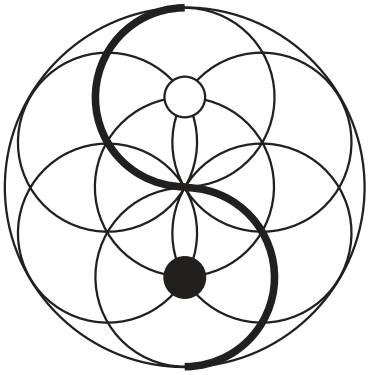

Figure 65. A way to obtain the Yin-Yang symbol from the Meraido

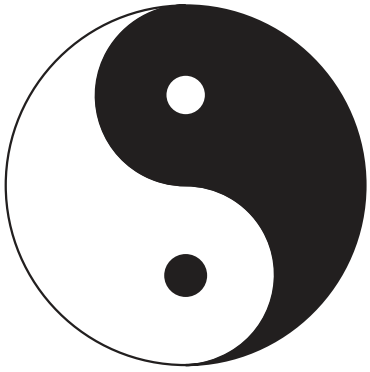

Figure 66. The Yin-Yang symbol

COMPARISON OF THE SPACE – TIME CURVATURE

Figure 67. displays the space – time function of the QI entity. This spatial and temporal curvature could remind us of the space – time curvature of the surveys conducted in the pyramids in Egypt.

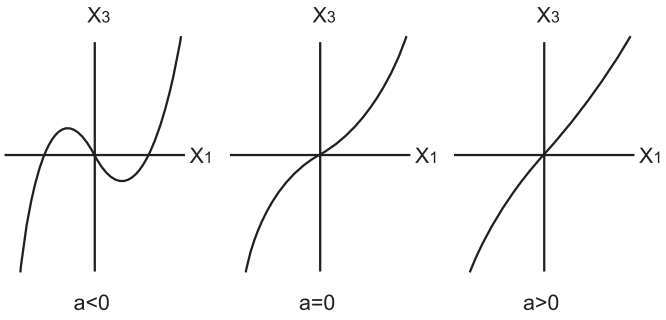

Figure 67. The appearance of function $X_3=X_1^3-aX_1$ for three different cases a<0, a=0 and a>0.

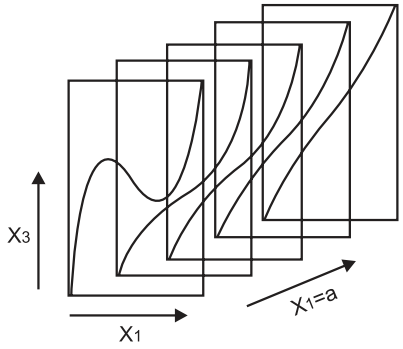

Figure 68. Successively observed appearance of $X_3=X_1^3-aX_1$ depending on the value of „a“ (time)

And this is how it all looks when we transfer it into 3D view.

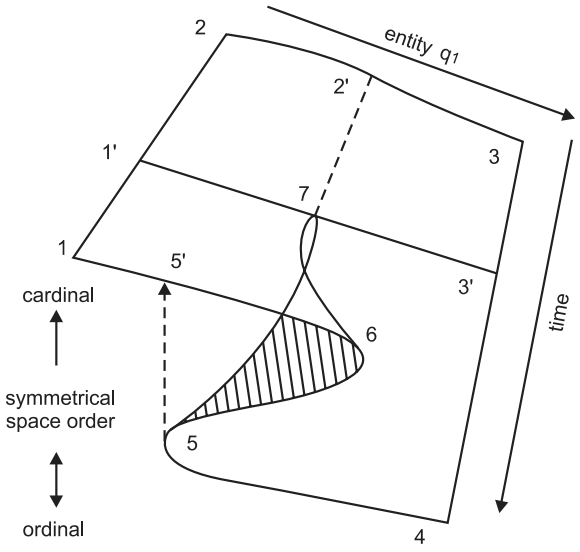

Figure 69. The QI entity as a symmetrical spatial order, with two states: ordinal and cardinal

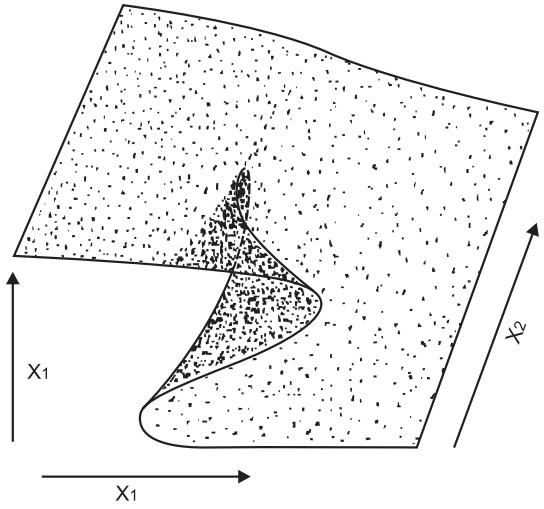

Figure 70. Spatial – temporal appearance of the QI entity

At the end of these short mathematical-geometrical explanations of YIN-YANG and the QI energy, all that is left is admiration for the experts of these ancient civilizations, who knew all these specific energetic qualities of the omnipresent energy of life, and who also knew how to apply them in practice.

CHAPTER TEN

PYRAMIDS – ACCUMULATORS, BATTERIES AND GENERATORS

– Pyramids are massive buildings, whose construction took an enormous effort, what with the use of stone blocks and other materials, which containes huge amounts of silicon, as we already mentioned.

One of the reasons (albeit, not the only one) was the need to accumulate orgone, which shall be explained henceforward.

PYRAMIDS AS ORGONE ACCUMULATORS

– In order to be able to absorb and accumulate orgone energy, pyramids were, in some cases, built of successive layers of diamagnetic and paramagnetic materials in horizontal order, just the way Wilhelm Reich was building his orgone accumulators (chambers).

Figure 71. A sandwich of diamagnetic and paramagnetic materials

At the site of the Bosnian pyramid of the moon in Visoko, where excavations are currently under way, layers of paramagnetic and diamagnetic materials are similar to the illustration in Figure 71. On top of the paved paramagnetic material made of stone, a thicker layer of diamagnetic material was placed, followed by paramagnetic paving and so on, just like a big sandwich, which is typical of an accumulator intended for the absorption of orgone energy.

PYRAMIDS AS SCALAR COMMUNICATORS AND PSYCHOTRONIC GENERATORS

– Talking about the pyramids, we have to accept the fact that not everything is quite as simple as it looks at first sight. These massiveorgone accumulators and generators, which use energies of subatomic particles in their activity, alo known as invisibles. In atomic physics, these particles are called neutrinos and anti-neutrinos.

– Talking about these invisible energetic particles, which emerge during the beta-decomposition of radioactive materials in the Earth's interior, as well as in the interiors of other stars, it should be said that there are two types of neutrinos and anti-neutrinos.

A neutrino can only appear in the company of an electron, during the decomposition of a neutron, or in the company of a meson, during the decomposition of a pion.

In the first case, we are talking about an electron neutrino. In the latter case, it is a myome neutrino.

The obvious question is, why is the presence of these subatomic particles so important to us for the description of the pyramids' function?

The reason is that the extremely fast electrified energetic particles, while leaving the interior of the Earth and upon encountering water, create a narrow, thin heated channel that causes the appearance of a sound wave in the water which, in return, repeatedly creates a certain acoustic resonance of the water. Recent research around the world has demonstrate that water, from a molecular point of view, is easier to dissolve by means of sound, rather than electrolysis, with minimal energy consumption.

This acoustic resonance then spreads throughout the whole pyramid object, due to the built-in crystal materials inside the pyramid, as well as into the internal chambers, which become resonators.

Just like a violin has a specific shape and material build, in order to amplify and direct sound waves, the pyramid also becomes an infrasonic oscillator, like a specially constructed violin. Under the influence of major voltage differences between the ionosphere and the Earth, as well as electric impulse outbursts and infrasonic oscillations, along with the presence of earthly radiations and their great mass, pyramids become generators of scalar waves and, thereby, psychotronig generators in a certain sense.

Not without reason, pyramids can be categorized as quality telepathic communication stations, as some kind of radio transmitter intended for transmission of telepathic messages in local, intercontinental, or intergalactic space. The reason for such a belief is the fact that they produce scalar waves, as does the human brain, but they suffer no loss of energy over a distance, like the well-known Hertz waves do. While passing through hyperspace, scalar waves suffer no time loss either, because each message is unfolding in time – right now.

Recent research into noises and energetic signals from distant galactic expanses imply that this type of communication has its basis, because telepathic messages are not familiar with concepts such as time, matter, or space. This claim follows from practical proof of communication with submarine crews at great oceanic depths, and with satellite and rocket crews, when they are out of the range of radio signals, but telepathic messages sent from the Earth are received immediately.

– Long before the telephone, satellite, or cell phone were invented, this telepathic messaging system was working just as fine as it does today.

Precise measurements were made in and around pyramids with very expensive devices.

What happens in the interior of the pyramid might sound like science fiction, as well as an area where physics meets paraphysics.

It should be assumed – and some measurements confirm this – that there is a constant, joyful and delighted dance of various energies and virtual particles inside the pyramids, in permanently changing and irregularly rhythmical motion.

This energetic and rhythmic, shall we say, spiritual rhythm, depends on current presences and amounts of different states of energy, on energetic currents of measurable and immensurable, yet present energies, and wave-like energetic forms.

It is very well known that many magnetic, electric, gravitational, neutrino, biophotonic, scalar, sonic and orgone saturations participate in this unrestrained dance, along with constant and continuous collisions and flashes of virtual particles of the entire spectrum of terrestrial and cosmic forces.

By measuring the cosmic radiation, it was shown that the space in the area around the pyramids isn't even roughly an Euclidian space; it is, rather, completely folded, and this is why the measured results are completely incomprehensive. The law of each pyramid is that it has a certain built-in constant, which depends on its use, and this is the so-called refractive hyperindex for scalar waves, under the condition that we observe the pyramid as a lens, since the orgone energy submits to the laws of optics.

In the case of Khufu's pyramid (or Cheops pyramid, see Fig. 72), this constant amounts to 1.618033989, which is the famous golden section, a number we encounter in each harmony of musical intervals, in symmetries and buildings, about which Gihka wrote a sizeable book.

Egyptologists and pyramid research experts believe that Khufu's pyramid is the most ideal example of proportional harmony, and this is the reason why it is taken as a basis for the creation of samples, and the creation of various mathematical and energy calculations.

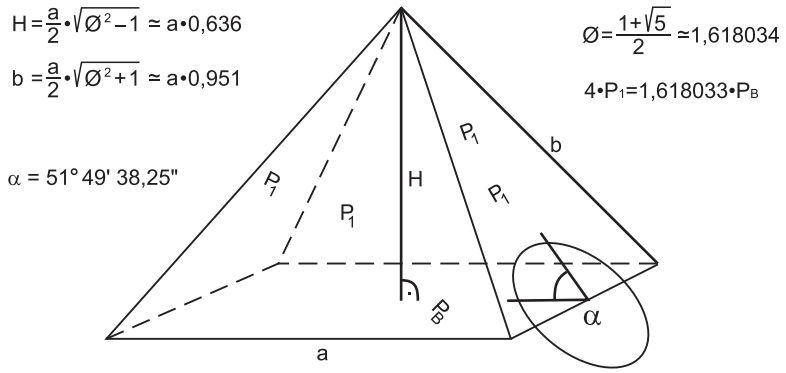

Figure 72. A schematic display of Khufu's pyramid

The flow of energy through a pyramid, and the biggest outburst of scalar waves at its top is achieved at the same time when singularity with the earthly tellurian oscillations is achieved, and the lateral influx of the outer field's energy is determined by the (α) angle, the inclination of the lateral sides of the pyramid, its height, size and mass.

Being a component of the gravitational force, mass is very important in the case of pyramids, as is its height, lateral inclination of the pyramid's surfaces, which is the (α) angle, as well as the material that was used in the construction of the pyramid, and the building position, above the place where tellurian radiations intersect, along with many other details.

CHAPTER ELEVEN

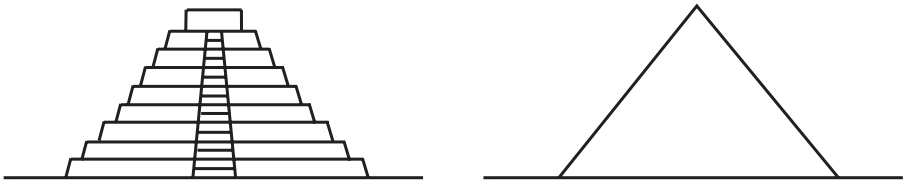
THE PURPOSE AND SHAPES OF PYRAMIDS

According to the research of many a scientist around the world, as well as the oral traditions of people who keep it as heritage and pass this ancient knowledge on, there are three basic funcional purposes of the pyramids:

1) Per-neter (house of nature)
2) Per-ba (house of prayer)
3) Per-ka (house of burial)

- Per-neters are pyramids whose purpose is to produce energy
- Per-bas are pyramids intended for prayer and sacrifice
- Per-kas are pyramids used for the burial of dignitaries

The original role of the per-neter was to produce, transform and transmit energy and information.



a) PER-BA b) PER-KA

Figure 73. Lateral view of a coupleof pyramids

CATEGORIZATION OF PYRAMIDS ACCORDING TO THEIR CONSTRUCTION TYPES

– According to their construction types and shapes, there are many types of pyramids. Some are steplike, some have slanted smooth surfaces, others have a spiral ascending shape, while yet others have a plateau at their upper part, etc.

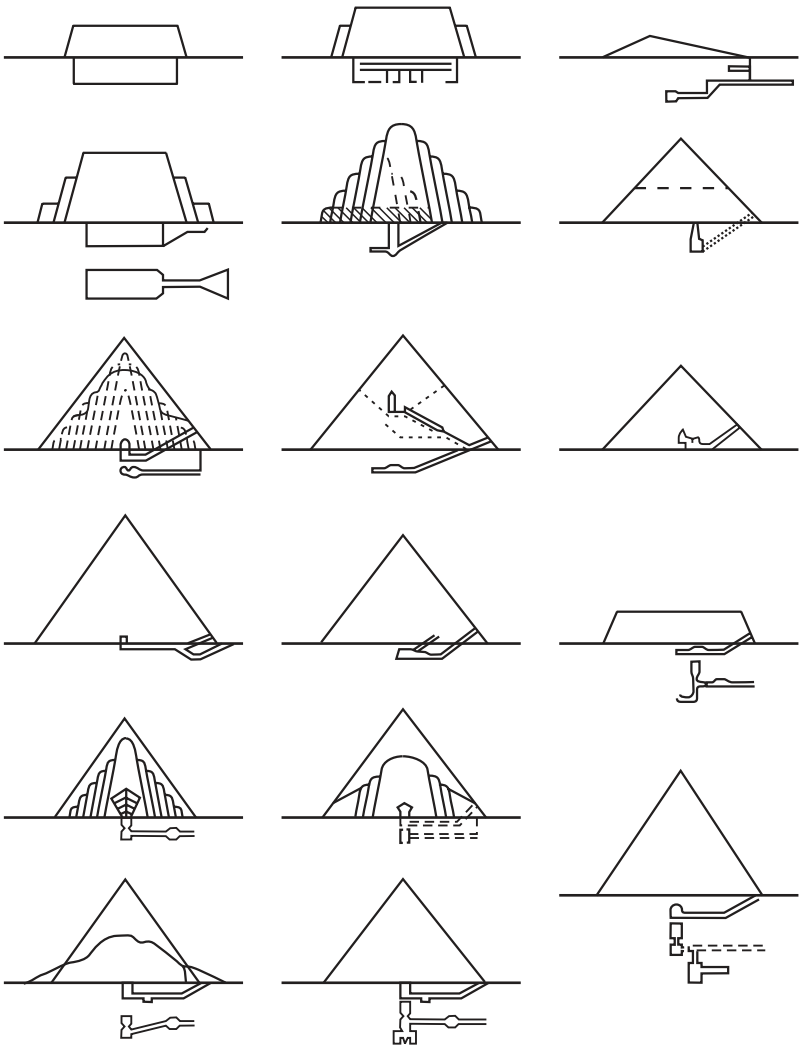


Figure 74. Section of seventeen Egyptian pyramids. The existence of rooms and chambers below the pyramids appears to be a rule.

BOOK THREE

THEORY OF A FREE MIND

CHAPTER TWELVE

ENERGETICS OF THE PYRAMID

Only a great enthusiast without prejudice, or a very determined man with lots of courage and knowledge could engage in explaining the energetic functioning of the operation of a pyramid.

– Explanations of the pyramids' energetics have been skillfully avoided in all books about pyramids. It is obviously too hot a property or too sour a grape; still, presenting a completely new theory for the reader's perusal is worth the while.

– In order to explain the energetic functioning of pyramids, it will be necessary to apply both physics and paraphysics knowledge, and be aware of the explanations mentioned in this book up to this point.

– The energetics of the pyramid begins in the zero-point field of the Earth, and it travels up to its surface, passes through the air and through the ionosphere, and leaves for the galactic expanses, carried by neutrinos and scalar gravitational waves.

– The assumption is that the neutrinos, which come from the interior of the Earth, have a range of several light years.

– According to Nikola Tesla, the scalar waves generated by the pyramids leave for the fourth dimension of our multidimensional universe, using hyperspace and perforating the astral sluice-gate.

– Observing all the aforementioned surveys and the effects created by the pyramids, we are right to assume that they connect us, in a specific way, with the energies of the stars in our galaxy, with the whole universe, and with multidimensional space and time.

– Today's science is still stubbornly separating space from time, as if these were two separate terms, even if it can be righteously assumed that the space-time connection is a very tight one in deed. This is confirmed by mathematical calculations regarding the curvature of the space-time dimension, which is very obvious in the case of pyramids. The measured results imply the fact that the area in and around the pyramid is completely folded, and this is why the results of the surveys conducted with state-of-the-art technology are, actually, incomprehensive and impossible.

When explaining the energetic functioning of the pyramids, we will have to – for a reason - circumvent the interpretations on which one of the ancient

civilizations of our planet could have had such enormous knowledge of the kind that was used in the construction of the first pyramids, how old they are, and who built them in the first place.

Based on the aforementioned, we already know that all pyramids are of an energetic character, but we also know that they were used for various specific purposes due to their energetic abilities.

In order to easily explain the ways of the energetic functioning of the pyramids, it is necessary to separately explain individual energetic components that are used, all of which collectively account for the entire energetic effective of these wondrous powerhouses.

INDIVIDUAL ENERGETIC AND FUNCTIONAL EXPLANATIONS

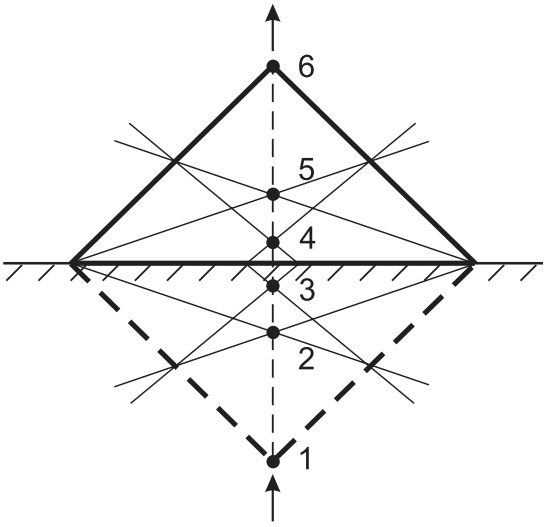

Figure 75. Focal points of the pyramid

The above image represents a simplification of the shape, setting direction and focal points.

Each pyramid (and for the sake of argument we are using Khufu's pyramid) has a rectangular base, four lateral surfaces, and six focal points. In this consideration, we also take into account the reflection of the pyramid, which is located below the earth.

With its base and its lateral surfaces, the pyramid is precisely directed in an east-west and north-south direction. This has its own deep meaning in regard to

the Earth's rotation around its own axis, and its rotation around the Sun, as well as the need to use the surface current of the force lines of the Earth's magnetic field, and the motion of the surface orgone from west to east.

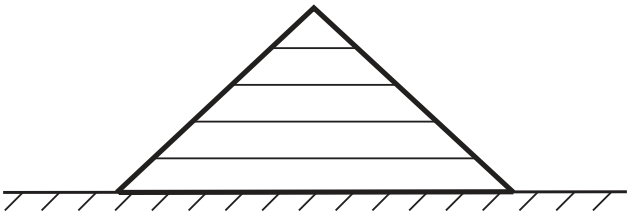

Figure 76. Pyramids are extremely massive buildings

In this segment of explanations, we shall turn your attention to the fact that pyramids are extremely massive buildings (see Fig. 76).

The length of each side of Khufu's pyramid is 227,5 meters, and a height of approximately 146 meters. According to some calculations, 5,995,000 tons of material were used in its construction (stone blocks rich in silicon).

Pyramids were built in places with strong gravitation, and gravitation isn't equal in all places according to satellite surveys. This gigantic mass of silicon provides the pyramids with great power of absorption of microwave, magnetic, and orgone energy.

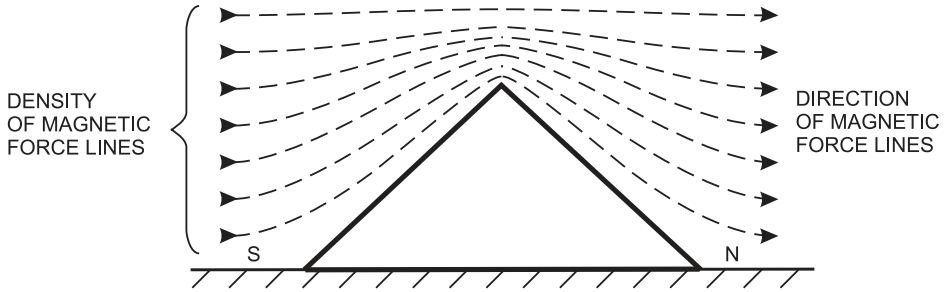

Figure 77. Illustration of the density of magnetic force lines

In Figure 77, magnetic equipotentials demonstrate the great difference in the density of magnetic force lines between the bottom of the pyramid and the top of the pyramid. This data will be of particular importance when we attempt to explain the energetic activity of the pyramid, as well as the direction of the magnetic force lines, which are directed above the surface of the Earth from the South Pole and toward the North Pole.

With this image, our attention is also turned to the height of the pyramid. The taller the pyramid, the denser the magnetic field at its top, which is just as important for the pyramid's functioning and energetic activity.

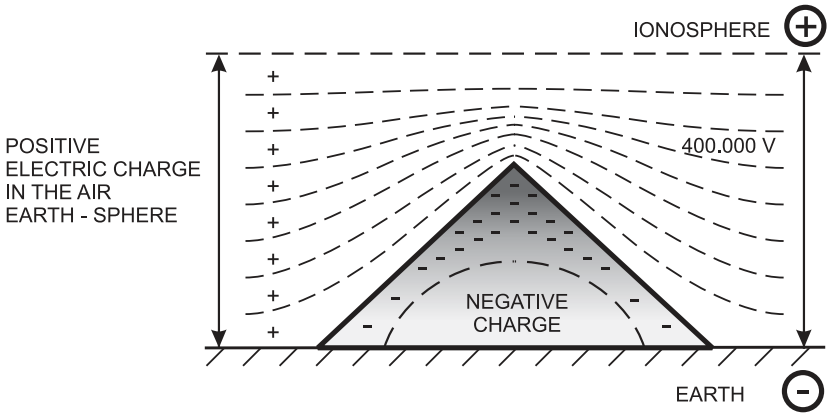

Figure 78. Illustration of the density of electric charges

With this image (number 78) we turn our attention to the density of electric charges in the air. From the surface of the Earth to the ionosphere, the field voltage increases for approximately 100 volt for each meter of height, which depends on many factors that we shall not elaborate any further. Between the Earth, with its negative charge, and the lower layer of the positive ionosphere, there is a voltage difference of some 400,000 volt according to some calculations.

Since the Earth is, by appearance, in the shape of ball, the charges of its minus polarity will be distributed in the surface layer and the densiest will be in the very top of the pyramid. The higher the pyramid is, the density and power of charges in the pyramid will be higher, but it also means the higher density and power of the positive charge on the location above its top.

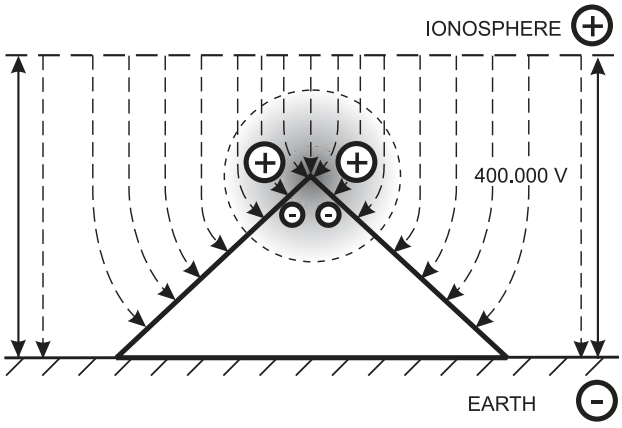

Figure 79. Locations of energy outbursts (top of the pyramid)

It is perfectly certain and logical that ionic smoldering discharges will take place at the top of the pyramid, due to the aforementioned magnetic and electric ionic components of the field around the pyramid, as well as inside the pyramid. These ionic discharges depend on many different factors, and one one of them is the momentary dielectric conductivity of the air, which is displayed in Figure 79.

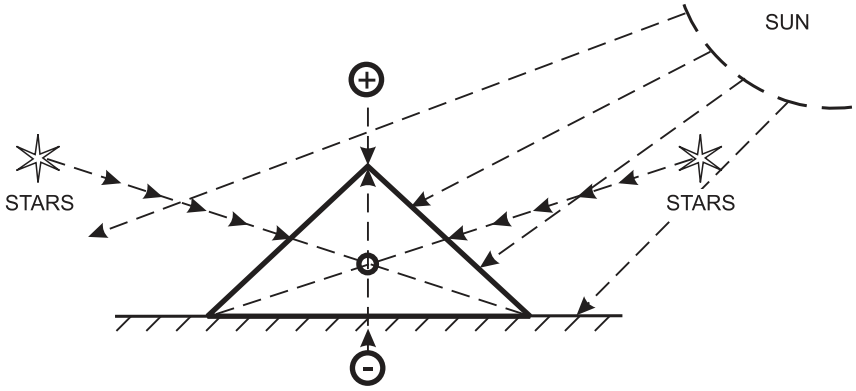

Figure 80. Exterior energetic impact from the galaxy

The above image (number 80) shows a schematic display of the impact of the energies of the Sun and the stars on the pyramid. The sun has a primarily thermal and biophotonic effect on the massive silicon structural construction of the pyramid. The effect of the accumulation of the magnetic impact is just as important, because the pyramid absorbs the magnetic field of the Sun and spreads it into the surrounding soil. This way, the magnetic field of the Earth grows stronger as well. The Earth receives huge amounts of metric waves and neutrinos from the stars. Because of this, we can say that the pyramids, in one of their segments, are electronic collectors of cosmic microwave energy, as well as gigantic accumulators of magnetic energy.

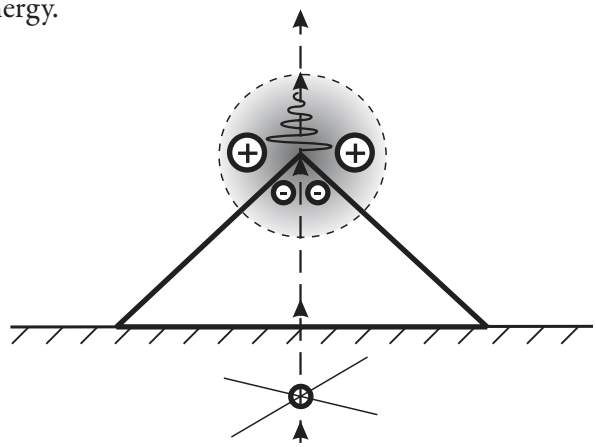

Figure 81. The pyramid as a scalar wave pulsar

Pyramids were built in spots that have very powerful earthly radiation (Figure 81) at intersections of telluric radiation. Nikola Tesla established that these earthly radiation nodes have sixty impulses per second. They pass through the pyramid stimulating a huge amount of silicon into pulsating. At the very top of the pyramid, they encounter existing ionic high voltage discharges, and the entire object enters a state of singularity with earthly radiation. This is when the pyramid becomes a powerful scalar wave pulsar.

Due to the type of material of which they were made, pyramids are crystal objects. The heavy burden of a pyramid pushes the lower crystal layers downward, thus creating a piezo-electric effect, which in turn creates a large direct-current charge, with the minus-charge of the Earth which it constantly touches. This is where it concentrates, only to burst out at the top of the pyramid. When the presence of the gravitational component is added to this charge, all that's left to do is to create pulsating, and scalar waves will emerge, which will cause the whole object to enter a state of rhythmic oscillation. In a pyramid, tonal pulsation is achieved through the neutrino thermal impact on water molecules. The pulsation is increased by bringing the pyramid's interior chambers into resonance, with the help of the network of tunnels. When the singularity with earthly radiation is achieved, i.e. the rhythmic ballance, the pyramid operates permanently as an energy object.

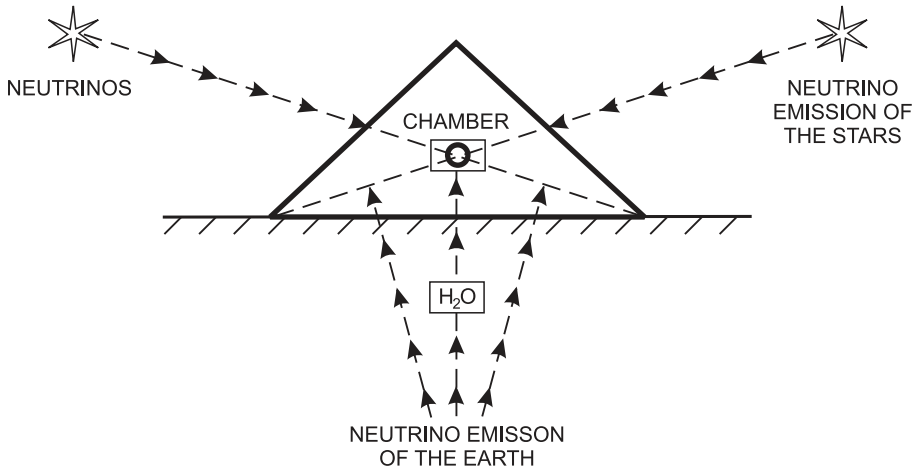

Figure 82. Impact of neutrinos on the pyramid

This image (Figure 82.) presents a simplified display of the impact of neutrinos from the depths of the Earth and from the starry sky. The origin of the neutrinos has already been explained, which is why it would be better to remind ourselves how tonal resonance is achieved in the chambers below the pyramid and inside the pyramid. When colliding with water, neutrinos create a narrow, thin and heated channel, and they cause the emergence of a sound wave. This is

constantly repeated and, regardless of the current state of the water (captured inside rocks, water steam in underground tunnels, underground water currents), acoustic resonance will take place.

This phenomenon, due to the silicon in the rocks, will spread to the entire pyramid by means of acoustic reasonance, and particularly into the central focal point where the main chamber is, aided by the impact of the neutrino emission of the stars. This way, the inner chambers (if any) become tonal oscillators. Due to the fact that the oscillations are infrasonic, it is only natural that we cannot hear them, but microorganisms cannot survive in these chambers, nor can mushrooms, because this resonance system is destroying them from a molecular point of view.

Because of the importance of the neutrino impact on water, we shall spend some more time explaining a phenomenon, in order to make the following topic easier to grasp. Recent research throughout the world indicate that water is easier to dissolve by means of sound, rather than electrolysis, with a minimum of energy consumption. Let us think back on the short impact of the Jericho trumpets, according to the biblical description. The destruction of Jericho and it walls indicates molecular decomposition of matter when exposed to powerful infrasonic activity. However, we shall hencewith emphasize the extraction of orgone from underground and above-ground water (displayed in Figure 83).

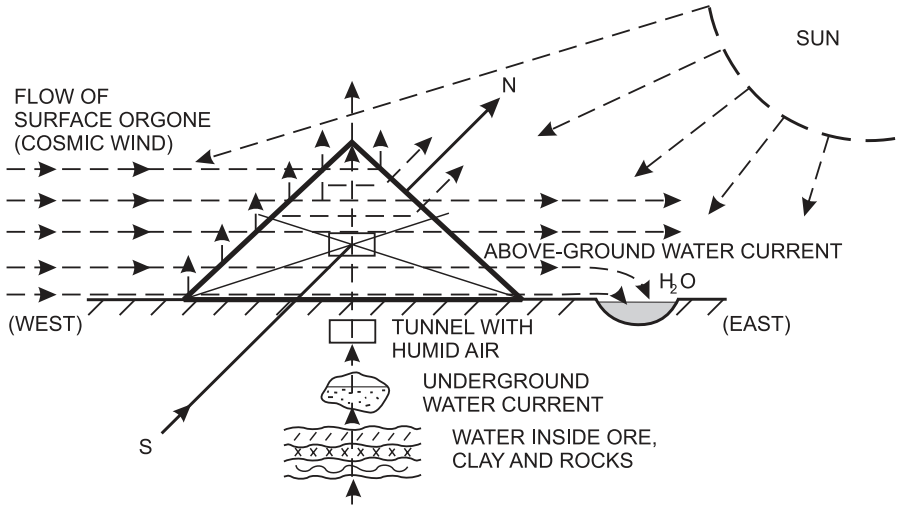

Figure 83. The pyramid as an orgone accumulator and generator

First of all, it has to be mentioned that orgone (life energy) is divided into warm orgone above the surface of the Earth, and cold orgone, which can be found in various forms below the surface of the Earth. We have already offered explanations regarding orgone on several occasions, but it won't hurt if we repeat some of them: orgone adores water; water absorbs orgone; orgone has

the tendency to move from a lower level to a higher level; water will shake off orgone when it runs into a place that contains more orgone; above the surface of the Earth, orgone moves from west to east; orgone submits to the laws of optics; the Sun creates warm orgone in the air, by means of biophotonic emissions; each magnetic field has its circular orgone field. Water flowing above-ground is also called „male water", and it contains lots of warm orgone. Water flowing below ground is called female water, because it contains cold orgone. In Figure 83, it can be seen that one part of the above-ground orgone is accumulated in the pyramid. It can also be seen that a part is redirected, and that it leaves toward the North Pole along with force lines. Another part separates and exits at the top of the pyramid, as well as laterally, while yet another part exits the pyramid on its eastern side, and this part absorbs the above-ground water current.

We cannot and should not think, not even for a moment, that orgone can be captured during accumulation. Since orgone is energy without mass, it can pass through any material, but at varying speeds. Water below the surface of the Earth, regardless of its state, contains cold orgone and releases it into the pyramid's interior, particularly if it is in an induced state, which is what neutrinos are for. Some also claim that orgone has its own self-consciousness, since orgone is a spiritual energy fluid, which is separately explained in the area of theosophy. At the end of this attempt at an explanation, it should be mentioned that orgone is associated with negative ions, and that it can be used to change weather conditions, since orgone is an anti-meteorologic fluid.

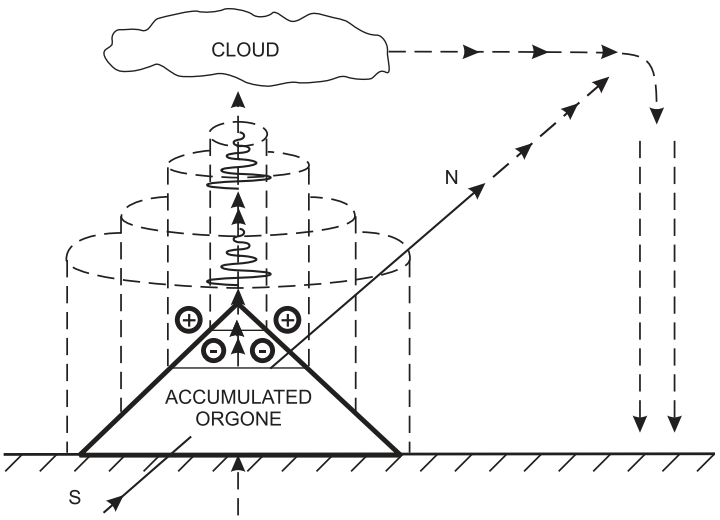

Figure 84. Motion of orgone and scalar waves

We have already explained that the pyramid works as an accumulator and a battery for orgone energy. In Figure 84, it can be seen that accumulated or

produced orgone has the tendency to move in a vertical direction through the pyramid and through air, affecting the clouds. What we are trying to emphasize here is the fact that vertically moving orgone surrounds itself with alternating circular fields of opposite polarities. The radiation belt of circular orgone energy is very big, especially in the case of such massive buildings. A part of orgone which is carried away to the north by magnetic force lines will end up in clouds, which will provide enough precipitation for the crop.

In order to avoid misinterpretations, these are just draft images. If we take a closer look at Figure 84, we can see that the scalar waves are encircled in orgone fields. What follows from this is that the pyramid could represent a radio station (a transmitter) intended to send telepathic messages over infinite distances. The pyramid builders were certainly aware of this. A pyramid can be used for therapeutic purposes, like so many do these days.

ENERGETIC FUNCTIONING OF THE PYRAMID

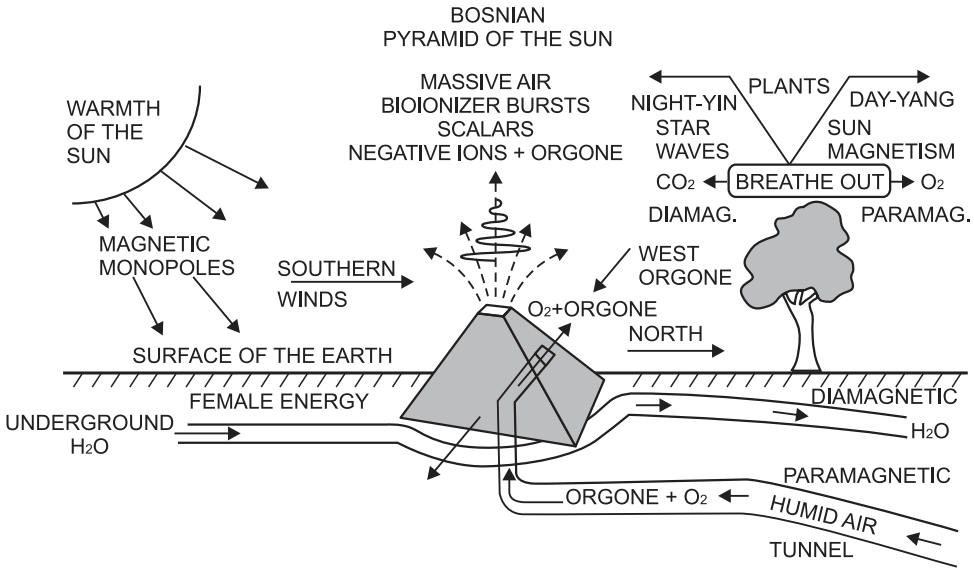

Figure 85. Display of energy flows

Figure 85. represents a collective schematic display of the aforementioned explanations.

When the pyramidal generators started working, outlet vents („chimneys“) were required to draw the orgone currents into the pyramid.

After the orgone started flowing inside the pyramid itself, joining the negative ions of this massive natural bioionizer, the channels and chimneys were partially or completely closed. Orgone has no mass, and it keeps exiting along the vertical of the pyramid. Underground water currents that surround the lower edges of the pyramid constantly shake off their orgone, thus accumulating energy into the pyramid.

Four circular holes can be found on all four edge ends of Khufu's pyramid.

When Wilhelm Reich created his orgone accumulator, or orgone cabinet, he connected the outer wall with ten liters of water by means of a hollow tube.

In the case of Khufu's pyramid, direct connection with water was achieved by means of a hole that led to a natural cave (Figure 133.) in the groundwork, and an underground ditch inside which there must have been water. In order to make this gigantic generator (pulsator) work at full capacity, a good oscillator was needed in order to achieve singularity with the Earth. Old shamans tuned their flutes to a frequency of 438 Hz. Through acoustic measurements, it was determined that 438 Hz is the resonant frequency of the „King's chamber" of the Great pyramid in Giseh. The assumption is that a major role was played by the water from the cave and the ditch, since we know that water also works as a stabilizer. The chambers and galleries are acoustic oscillators and resonant filters. We can assume that the neutrinos, which are coming from the depths of the Earth, have created an acoustic resonance passing through underground water currents, and this resonance was transfered to the whole object through the angular foundations of the pyramid.

Figure 86. A natural cave in Khufu's pyramid

Such a tonal oscillator only needed to be tuned to a precisely defined rhytmic oscillation. Upon achieving singularity, the needless tunnels and chimneys were closed with covers, and the orgone generation had begun, along with the pulsating of scalar waves throughout the entire building. Such rhythmic gravitational quakes in the infrasonic band, around 13 Hz, was measured in the Bosnian pyramids by Russian geophysicists Khavroshkin and Tsyplakov.

Figure 87. demonstrates how the covers were used to close individual passages in order to stabilize tonal resonances within the chambers of the Great pyramid in Giseh. We can see chiseled grooves used to close the tunnel system. All the slanted ventilation tunnels in the Great pyramid in Giseh were closed from the outside, just like all chimneys in the Bosnian pyramids.

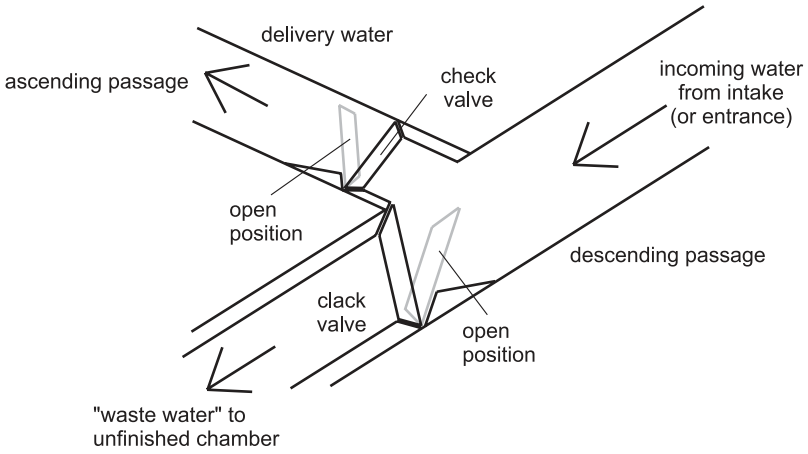

Figure 87. Channel grooves in Khufu's pyramid

While installing internal illumination and a sound system in the ascending passage in 1971, a natural cave was discovered below the Pyramid of the sun in Teotihuacan.

This discovery sheds light on the reasons behind the construction of the pyramid in this very place.

HOW TO MAKE THE PYRAMID WORK

No energy system, be it a steam engine, some kind of pulsator, a generator, or a liquid fuel engine, will not work by itself. In order to work, it needs some initial adjustments. This is why we shall use a comparison with another engine in order to illustrate the initial operation of the pyramid.

Because of this, we need to go back in time and visit the recent past. Let us remember the old technology from the time of the first piston engines, which were using oil as fuel.

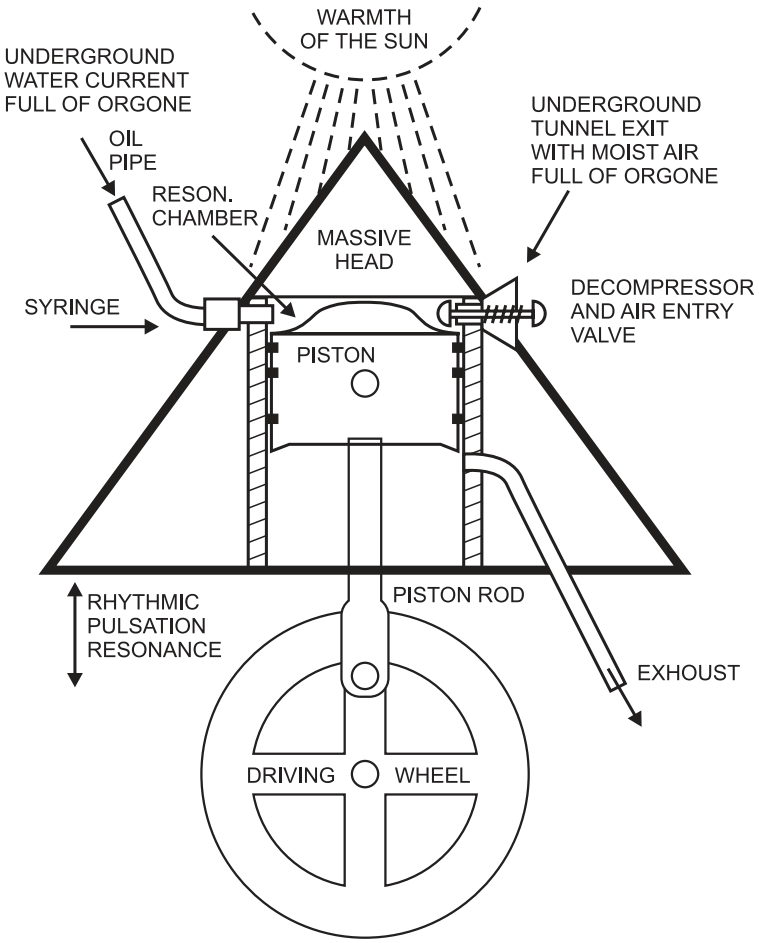

Figure 88. Comparative illustration of the starting of the pyramid and the starting of an engine

Figure 88. presents a very old type of diesel engine, which only had one cylinder with a big diameter. This cylinder was set horizontally, with a massive head made of cast steel. The starting of the piston was made possible by a huge and heavy driving-wheel, which was also used as a machine belt for the transmission of the operational rotation.

What follows is the starting sequence of the engine:

1. heat the head until it becomes red-hot
2. squeeze the cylinder decompression valve
3. rotate the driving-wheel
4. approach the funnel with a burning oily clout
5. when the piston inside the cylinder withdraws some oil fumes from the clout, oil is injected into the hot chamber with oil fumes with the help of the syringe
6. letting go of the deompressor, upon which the compressed ignited fumes start the piston
7. the engine is working and singularity is achieved

This simplified comparison of the starting of an engine and the starting of a pyramid helps us understand how to start this massive generator and make it pulsate and achieve resonant oscillation, i.e. its operating function, and why the pyramid builders simply closed the chimneys and blocked some underground tunnels with dry walls after the operation was regulated.

ENERGETIC FUNCTIONING OF THE PYRAMID

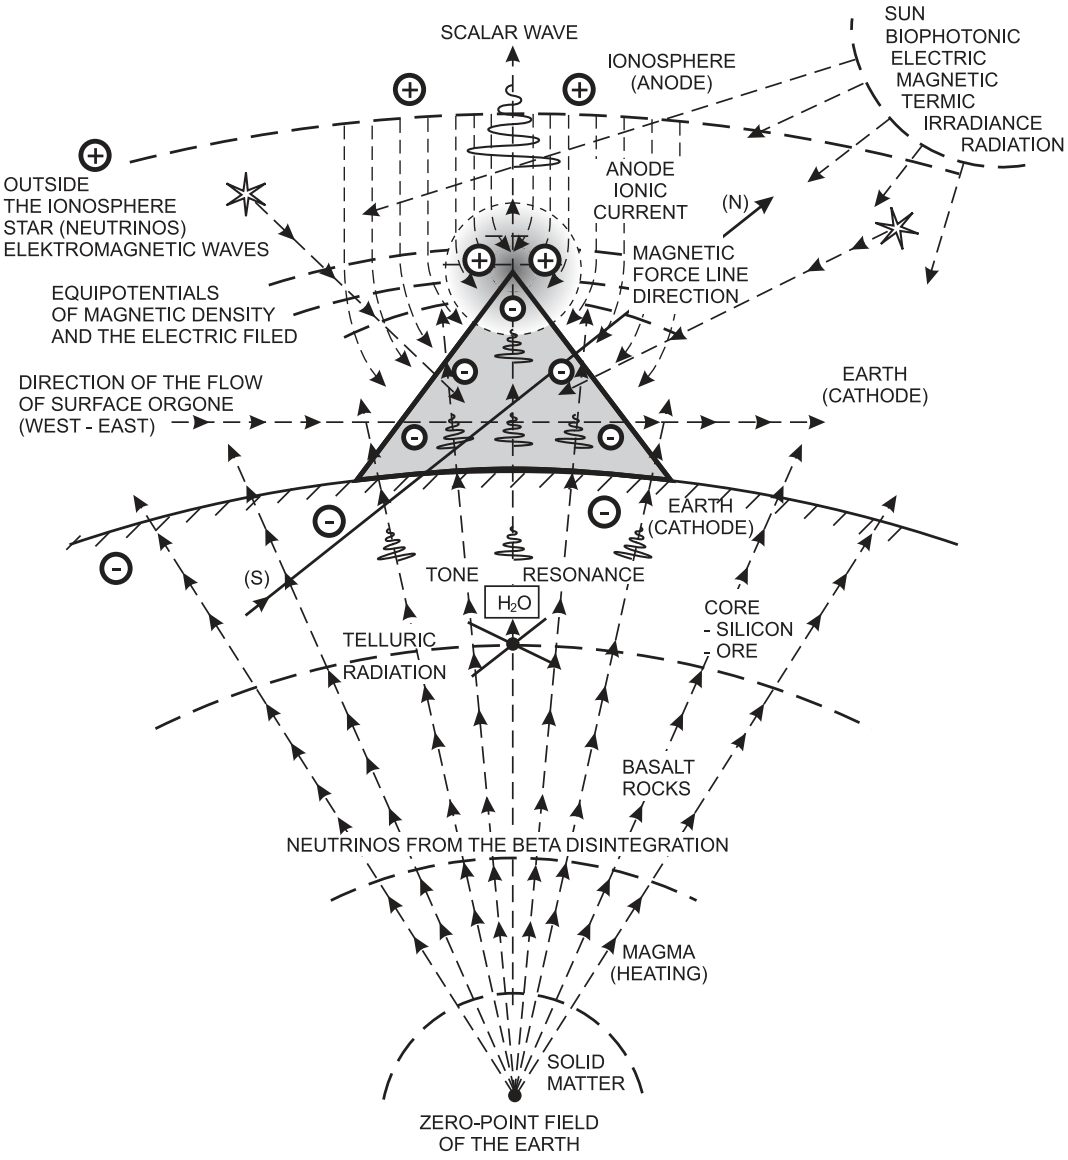

Figure 89. Collective schematic display of the aforementioned explanations

CHAPTER THIRTEEN

SECRETS OF THE STONE SPHERES

In different parts of the world, there are thousands of stone spheres. Like pyramids, these stone spheres were made of materials rich in silicon. They come in a variety of dimensions, sizes and weights, from those with a diameter of merely ten centimeters, up to those whose diameters exceed two and a half meters, and they weight tens of tons.

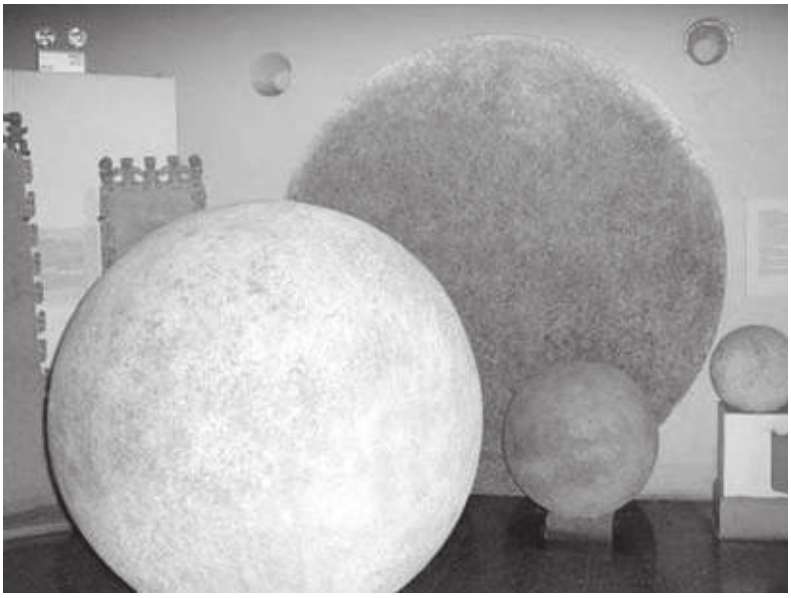

Figure 90. Stone spheres in the national museum in San Jose, Costa Rica

The outline of the biggest stone sphere discovered thus far is a monumental megalith with a weight in excess of thirty tons, the creation of which must have required a highly developed technology, which the primitive tribes of Costa Rica did not have 1500 years ago. There are also several other original stone spheres of various sizes in the image. What is fascinating about these stone spheres is how precisely they were processed, as well as their balanced centers of gravity.

Nobody managed to determine how old they are, who manufactured them, what they were used for, and how they were originally arranged. Most of the stone

spheres were found in areas of the world that are energetically very active, in places where ancient civilizations existed, and they are dispersed in areas that used to be cultivated (and some still are), along river basins. Some stone spheres sunk into the earth for some reason, and sometimes they are found only after excavations, deep beneath the earth. We can only assume that the ground cave in due to the geological activity of the Earth over thousands of years.

Up to this point, there were many attempts to explain what these stone spheres represent. Sadly, most theories are highly illogical and make no sense whatsoever. What I shall explain hencewith is another very brave, but also very logical theory, which I would like to present to the public for their perusal, the way I see it and, of course, from the perspective of energy.

It was neither possible nor necessary to build massive pyramids everywhere in the world. Gigantic energy powerhouses and radio stations aren't built in just any village or small town, not even these days. Huge energy plants are built in areas which have the most consumers, where it will pay to invest all the effort and time to build them. My humble opinion is that the stone spheres were small energy generators, under the condition that there were several of them in a given area, and that they were arranged in a specific and logical way, from an energetic perspective, according to their direction and their respective sizes.

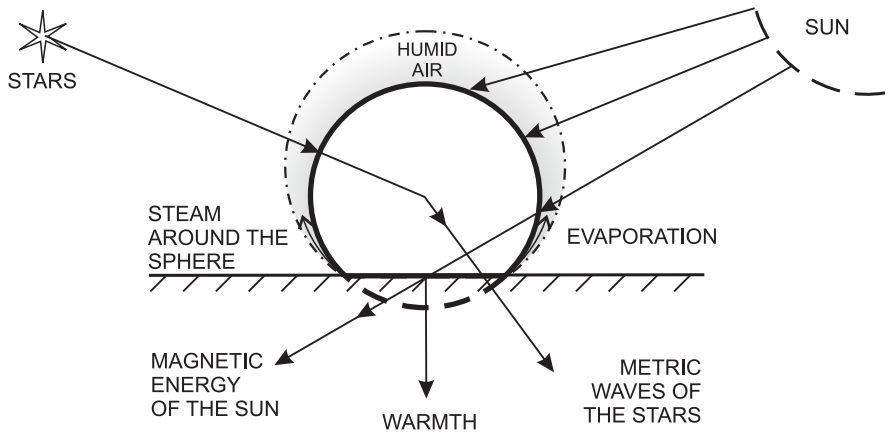

Figure 91. Impact of the Sun and the stars on the stone sphere

A sketch of the stone sphere (in above Figure 91) demonstrates that, due to the transfer of warmth, while it is lit by the rays of the sun, there is some water evaporation from the moist soil, and humid air gathers around it. The sphere is,

at the same time, an accumulator of the magnetic energy of the Sun, which it transfers into the ground.

At night, this stone sphere receives metric waves of the stars, since its silica content resonates and transfers these waves into the earth all night long.

These are really small amounts of energy that the sphere receives and transfers into the earth, but we know that there are many spheres on each site in a given area. This is just a part of the functions which are performed by using stone spheres.

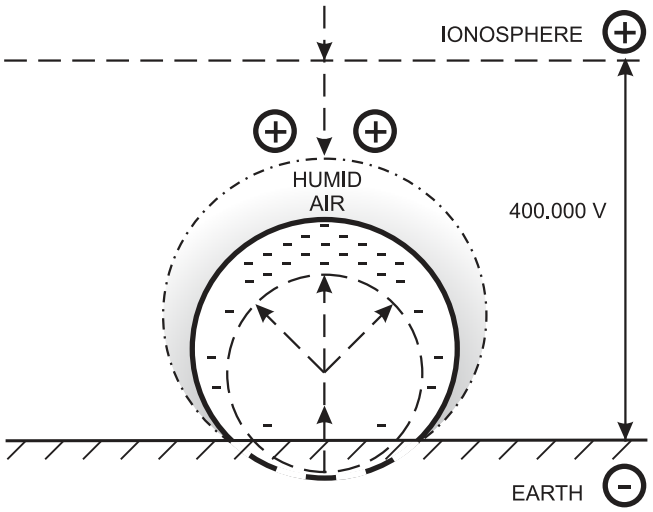

Figure 92. Arrangement of the density of charges in a stone sphere

This image (Figure 92.) demonstrates that the minus charge isn't equally arranged throughout the inner part of the stone sphere.

The reason for this is that the sphere is partly immersed into the soil, which has a minus polarization, and this means that the zero point is somewhat lower in regard to the spheric portion. Another reason for such an arrangement of minus charges is that the sphere is in a plus field which has a voltage difference of 400,000 volt in relation to the minus-polarized Earth. This is certainly a good reason for the most dense minus polarity inside the sphere to be at its top.

The ideal spot for the discharge of ionic charges of the stone sphere and the charges of the sphere is the surrounding warm and humid air. The discharge spots that are very small, but present, will be located at the very top of the stone sphere for the aforementioned reasons (Figure 93).

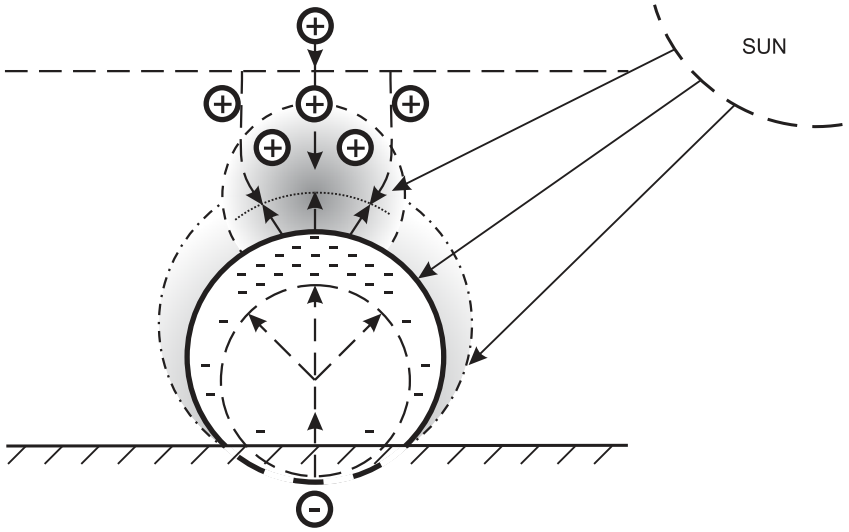

Figure 93. Ionic discharge of the stone sphere

We have already explained that orgone is associated with negative ions. The cold orgone from within the earth is now located in the warm and humid air around the sphere, and it becomes a participant of the ionic discharges and further exposure to the light of the Sun (Figure 94).

By means of the biophotonic emission of the Sun, with small, yet present ionic discharges in the warm and humid air that surrounds the stone sphere, the omnipresent virtual particles will be forced to collide and, with the presence of plus-polarization, they will turn cold orgone into warm orgone.

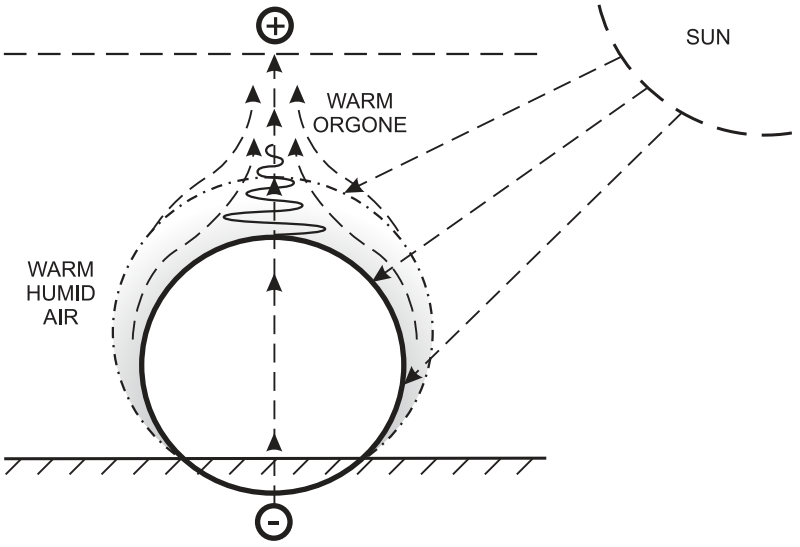

Figure 94. Orgone flow off from the stone sphere

We know that cold air flows downward, towards the Earth, while warm air goes upward, towards the sphere. This is exactly what shall happen and, by multiplying these events, warm orgone shall flow upward, towards the ionosphere.

It was already explained that orgone has its own circular orgone field of alternating polarities. When a stone sphere is placed in a spot of increased telluric earthly radiation, along with the aforementioned properties and the crystal structure of the stone sphere, there will be a small, yet noticeable singularity, and scalar waves will start flowing along its vertical, towards the ionosphere.

We can see that this is basically a pyramidal energetic function in a lesser energetic form. However, those ancient builders had a solution for this.

The complete energetic impact of a stone sphere is illustrated in Figure 96.

Ahmed Bosnić, Ph.D. Aly Barakat, Ph.D.

Figure 96. Stone spheres in Zavidovići (Bosnia and Herzegovina)

SUMMARY ENERGETIC PULSATION OF A STONE SPHERE

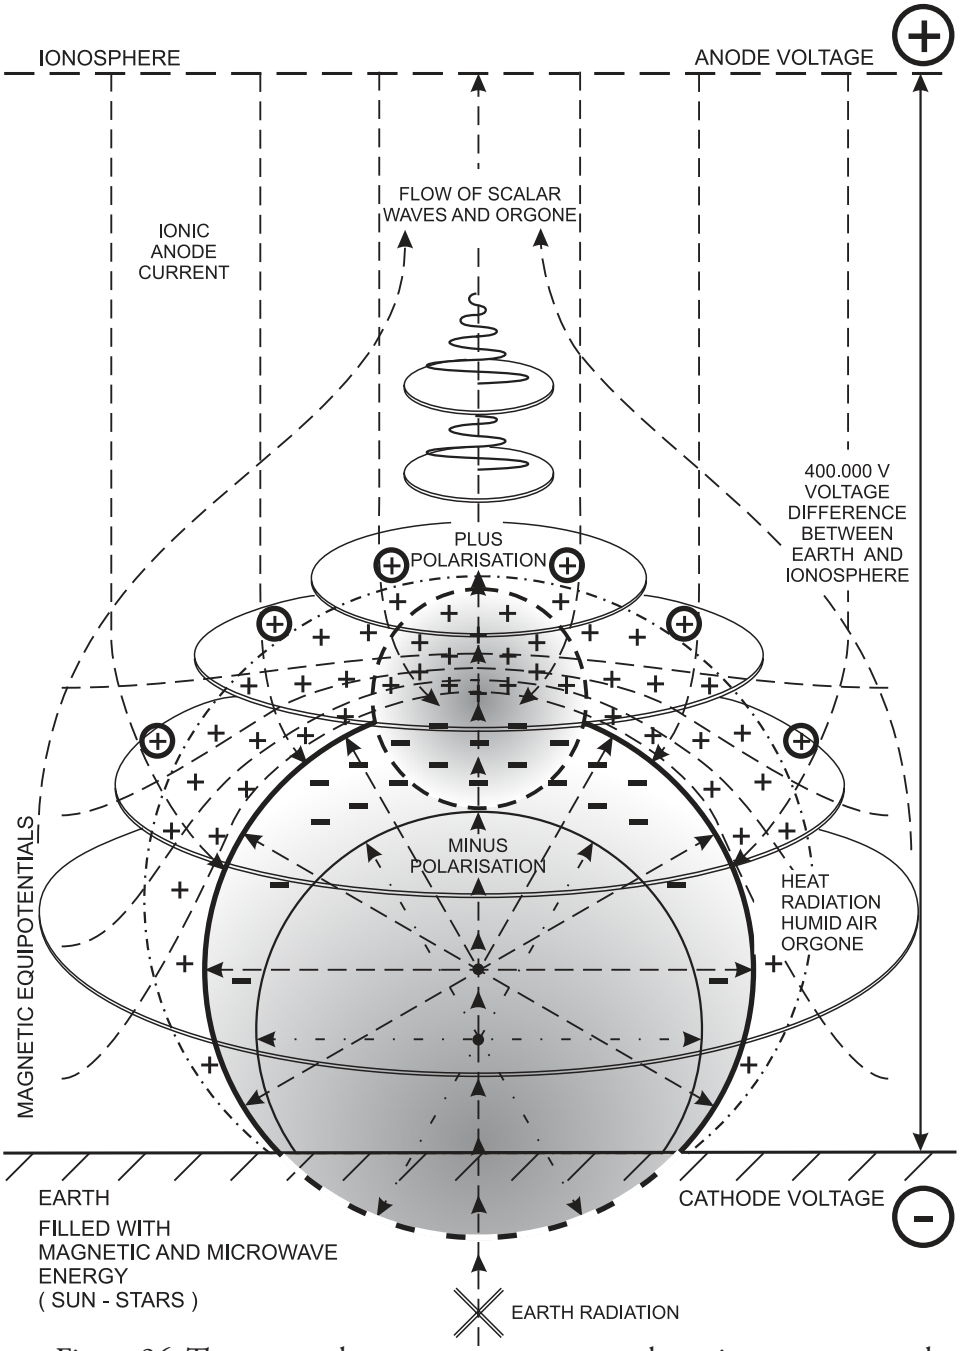

Figure 96. The stone sphere as an energy accumulator, i.e. an orgone scalar generator

THE EARTH'S MAGNETISM

On the Earth, the magnetic needle is directed in a certain direction, and so we conclude that there is a magnetic field around the Earth or, in other words, that the Earth is a magnet whose South Pole is in the north, and whose North Pole is in the south (Figure 97.a). The magnetic and geographic poles of the Earth are not in the same point, and their position changes with time. The deviation of the geographic north – south direction (the geographic meridian) from the direction shown by the magnetic needle (the magnetic meridian) is called the magnetic declination. The magnetic needle, which can rotate in a vertical plane, is represented under an inclination angle toward the horizontal. This angle is called magnetic inclination.

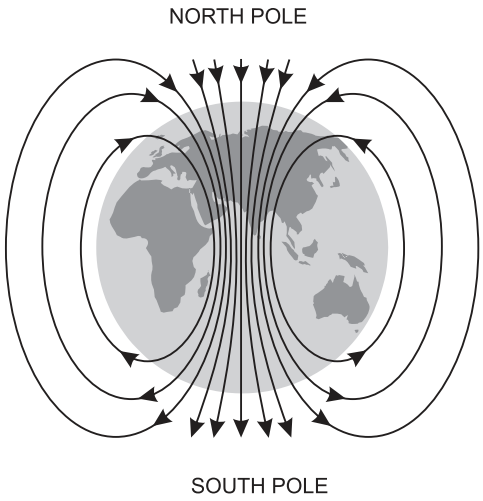

Figure 97. a)

According to the aforementioned explanations regarding orgone motion, it moves along the surface of the Earth in a west – east direction. From the notion that each stable magnet has its own orgone field, along the magnetic force lines of the Earth, from a horizontal perspective, orgone motion would appear the way it is displayed in Figure 95.b).

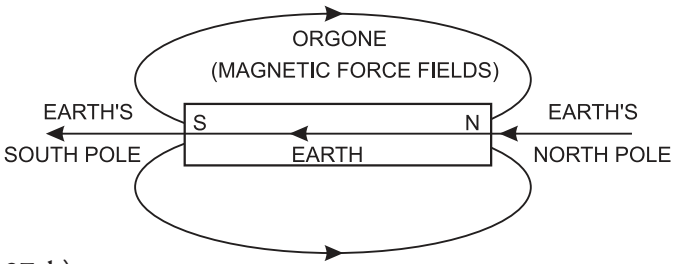

Figure 97. b)

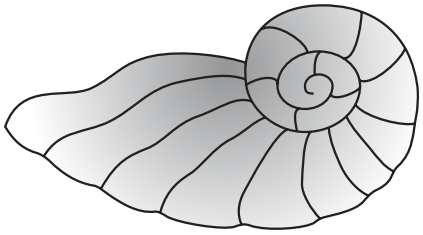
Orgone motion along the magnetic line forces is directed towards the north.

- Several ways to increase orgone energy shall be discussed in the continuation of this very specific subject.

The laws of the universe, and of the motion of the QI life energy, as it is called by the Chinese, is displayed by a spiral, which moves to the right, in a circle, from its starting point, which makes it look like a snail shell (Figure 98.).



FORAMINIFERA
11 million years ago

Figure 98.

By looking at this image, we can see that nothing has changed over the last eleven million years, Nature has its permanent laws, on which the functionality of the whole universe is resting. Life energy or, as was repeatedly mentioned in this book, orgone energy has the tendency to move in a spiral fashion toward the right, from a lover to a higher level.

In order to make the forthcoming explanations easier to understand, regarding the possibilities to increase orgone energy with the help of stone spheres, we have to look back at previously discussed subjects and to revise:

- Orgone moves from lower levels to higher levels. Any stable magnet has its own orgone field, which implies the possibility that orgone, in free space, will partly direct itself in the direction of the flow of magnetic force lines. The Earth is a gigantic magnet, which has its north and south poles, and a constant flow of magnetic force lines from the magnetic north pole to the magnetic south pole.

This is why the orgone energy produced by stone spheres in free space will be directed in the direction of the Earth's magnetic force lines, and move towards the north.

Let us think in a logical fashion, the way these builders from ancient civilizations were thinking, while they were building their fabulous energy plants around the world.

Each electron, while spinning in its orbit around a core, has its own „spin", rotating around its own axis in a rightward direction. Most stars, including our Earth, rotates rightward. In accordance with this rightward spin of life energy, we

can assume what the arrangement of the stone spheres was, since they produce small amounts of orgone. The amount of the living energy of orgone depends on the size of the stone sphere: the bigger the sphere, the more orgone. Orgone moves from a lower energy level to a higher energy level. Orgone will be directed in the direction of the Earth's magnetic force lines.

From this, it can already be assumed why the stone spheres have different sizes, the way we find them dispersed around the terrain. It can be logically concluded why they were placed close to rivers and fertile fields, and why they were positioned in a northern direction, why they were arranged to form straight lines, triangles, or parallelograms. Let us try and explain this.

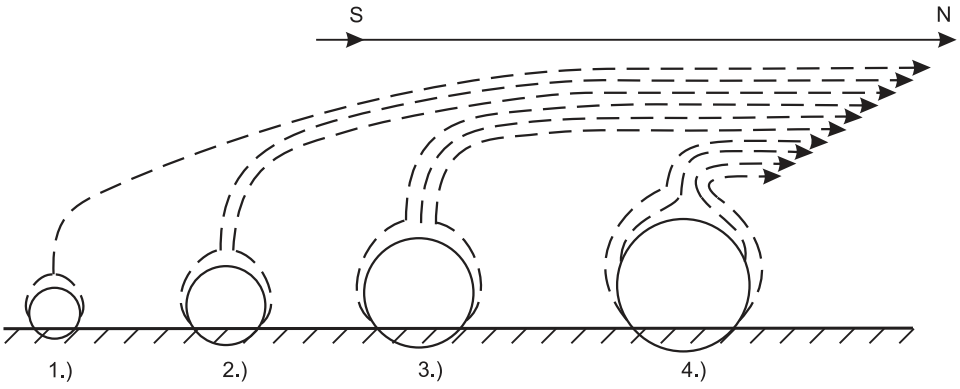


Figure 99.

Each stone sphere its own little share of orgone when it is exposed to the rays of the Sun, corresponding with its size, which then represents a cascade generator of orgone energy (Figure 99.).

Warm orgone, along with humid and warm air, rises upwards and attempts to climb from a lower energy level to a higher energy level. The number of stone spheres is unlimited, which can account for a long course with many stone spheres. It is important to adhere to the direction of the magnetic line forces, which shall aid its motion and orientation. We know that orgone is an anti-meteorologic fluid, and that those fields which are to the north of the arranged stone spheres shall have enough precipitation rich in the orgone life energy. This will certainly facilitate quality crop and a fine harvest.

Since the stone spheres, in some places, were found in equilateral triangle arrangements, it is logical to assume that this has its own meaning in the explanation of their energetic functioning (see Figure 100.).

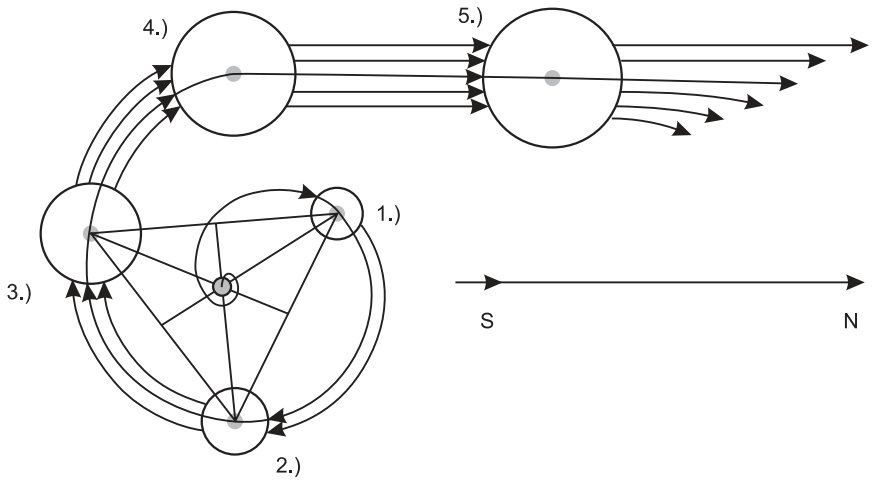

Figure 100.

Ancient experts used to say that a picture says more than a thousand words.

If there is an intersection of the earthly telluric radiation in the center of an equilateral triangle, we also have an initial source of energy, a source of cold orgone.

If we would place the stone spheres in the corners of the triangle, as is shown in the above image, and just two additional spheres in a northward direction, orgone energy would start flowing. Each sphere would produce some additional orgone and forward this orgone further, toward the next bigger sphere. The last sphere in this set would forward the increased amount of orgone in a northern direction.

If we take a closer look at this image of energy motions of the energy of life, we see a spiral of laws of the energetic life courses of the universe. Our present name for this shape is the „Fibonacci spiral". One of the images in a book titled „Land of Osiris", written by Stephen S. Mehler, presents Egyptian pyramids that are located in the Bu Wizer area, and the way they are arranged by size, and in the direction of the Fibonacci spiral, from the smallest one to the largest one, which is located at the end of the spiral.

This tells us that these ancient builders knew why energy plants have to be constructed this way, and why they must be arranged in a line, and by size.

If we would multiply our miniature orgone generator from the above image, and if we would arrange them into a harmonious line, we would get something that our present experts would call a cascade scalar generator of orgone energy. Now, let us take a look at the following image (Figure 101):

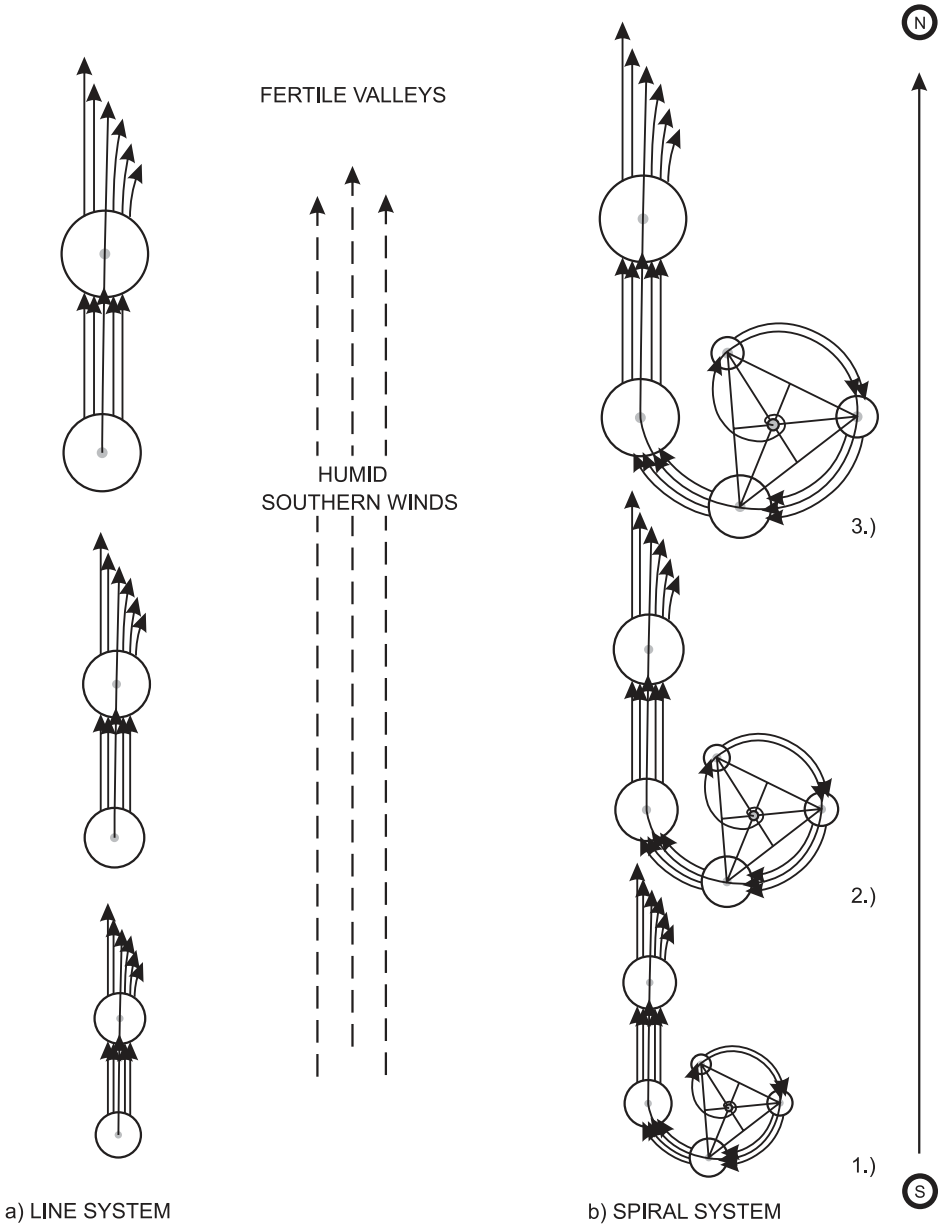

Figure 101.

However, there is more that can be done with stone spheres. Since the stone spheres were arranged into parallelogram shapes in some localities where they were found, here is another possible explanation:

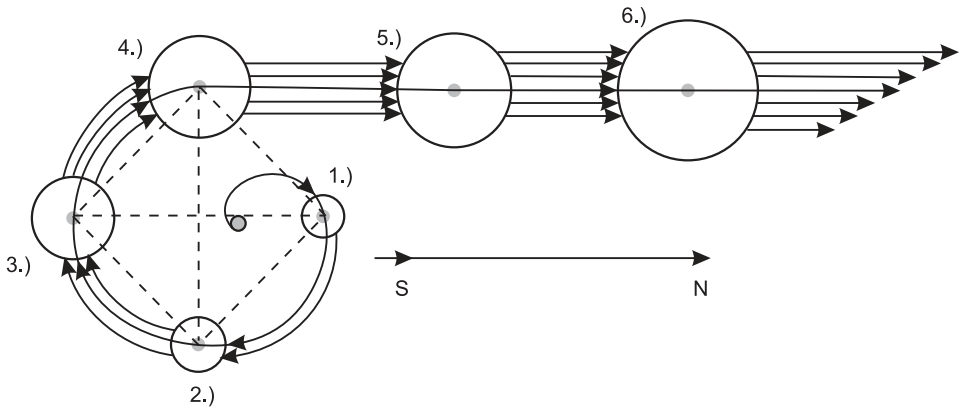

Figure 102.

A parallelogram is made of two isosceles triangles, and so four stone spheres, arranged in a way depicted in Figure 100, will yield a somewhat stronger generator of orgone energy.

It is obvious that this is also about generating orgone, which flows in the direction of a Fibonacci spiral, from lower values to higher value, with the orgone field eventually directing itself in the direction of the direction of impact of the magnetic force lines, which means toward the north – into some fertile valley.

It is believable that these old experts for natural energy processes and energy flows arranged these stone spheres according to the requirements and the possibilities of an optimal utilization of spatial energy fields, in order to produce orgone in the selected location.

We can also be sure that, in correspondance with the possibilities of a given area, they chose the arrangement of the stone spheres to be one of the aforementioned combinations; or else, they combined the sphere arrangement from several of the aforementioned system, using the cascade orgone energy generation system.

It is impossible to say for sure how the stone spheres were originally arranged, because spheres, of course, have the tendency to roll. Over thousands of years since they were arranged, some of them were moved by people, while others were moved by natural geologic activity.

BOOK FOUR

THE BOSNIAN PYRAMIDS

CHAPTER FOURTEEN

THE VISOKO PYRAMIDS

In 2005, Semir Osmanagić established the Archeological Park: „Bosnian Pyramid of the Sun Foundation", and he initiated research in one of the most significant archeological sites in the world, in the Bosnian valley of pyramids.

The existence of the colossal pyramid compound in central Bosnia shook the world, and with good reason, because the history of mankind will have to be rewritten.

The Bosnian pyramids are located in the vicinity of the city of Visoko, thirty kilometers north of Sarajevo, amidst the Visoko field, at the estuary of the Fojnica river into the Bosna river. The lowland of the river valley, the affluent forest and the mountain pastures, along with the favorable conditions of a moderate climate with sufficient precipitation, are a good foundation for farming culture and stock farming.

The official historiography mentions that a distinct cultural group was formed here during the Neolithic which is historiographically known as the Butmir culture. This culture's sites are most frequently found at the very center – around Visoko (Donje Moštre, Radovlja, Kralupi, Zbilje). The city of Visoko is the most famous center of the medieval Bosnian state, and a meeting place for state assemblies, as well as the coronation place of Bosnian rulers.

Illustration of archeological sites (Figure 103):

1. Bosnian Pyramid of the Sun (Visočica)
2. Bosnian Pyramid of the Moon (Plješivica)
3. Bosnian Pyramid of the Love (Čemorac)
4. Temple of the Earth (Krstac)
5. Bosnian Pyramid of the Dragon (Bučki Gaj)

(the sites were named by Semir Osmanagić)

6. KTK tunnel
7. Ravne tunnel
8. Gornja Vratnica

If we were to judge by the initial excavations, we may expect to find an extended network of tunnels below this area.

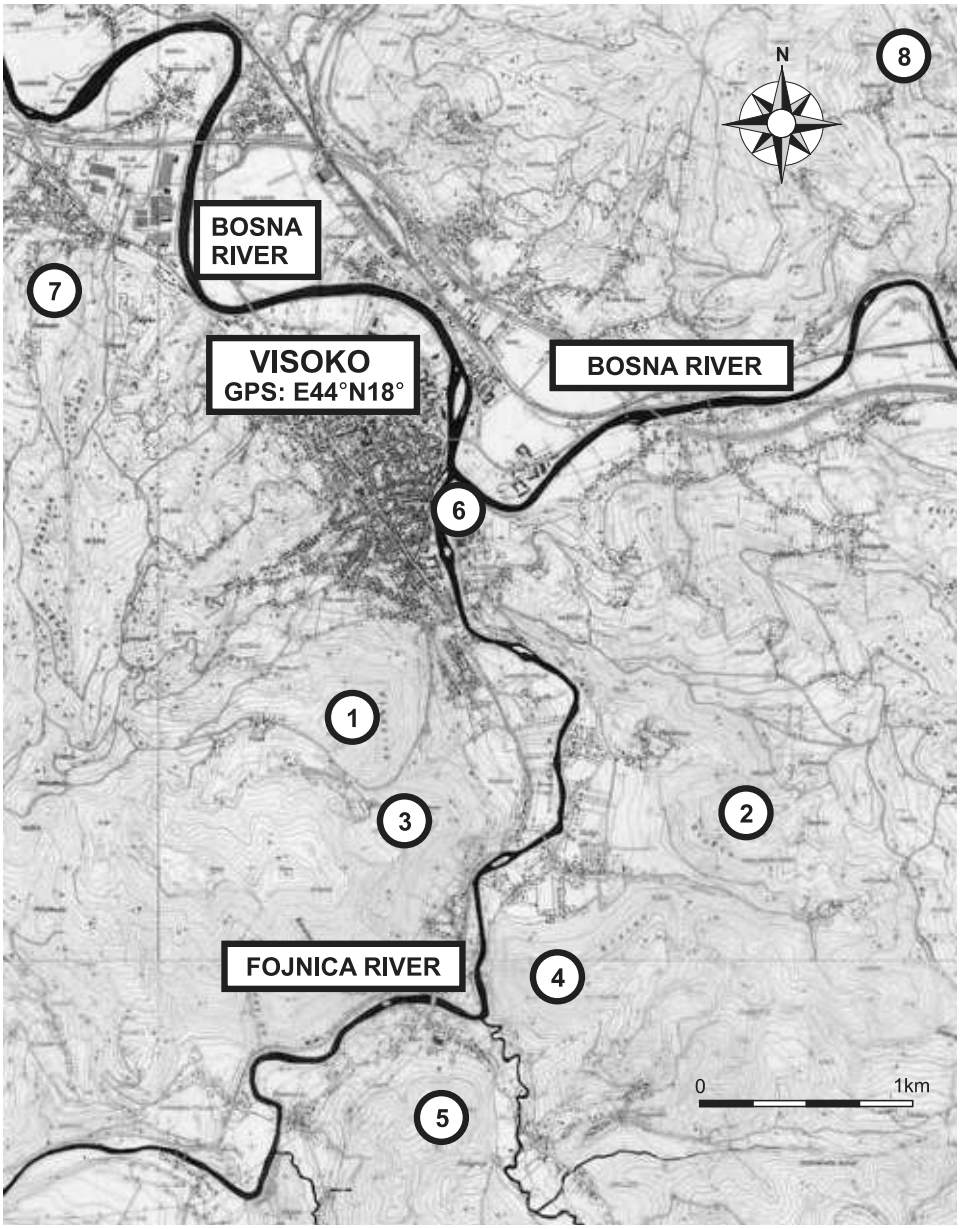

Figure 103. Display of archeological localities in Visoko

CHAPTER FIFTEEN

ARCHEOLOGICAL AND GEOLOGICAL EVIDENCE: THE 2007 CAMPAIGN

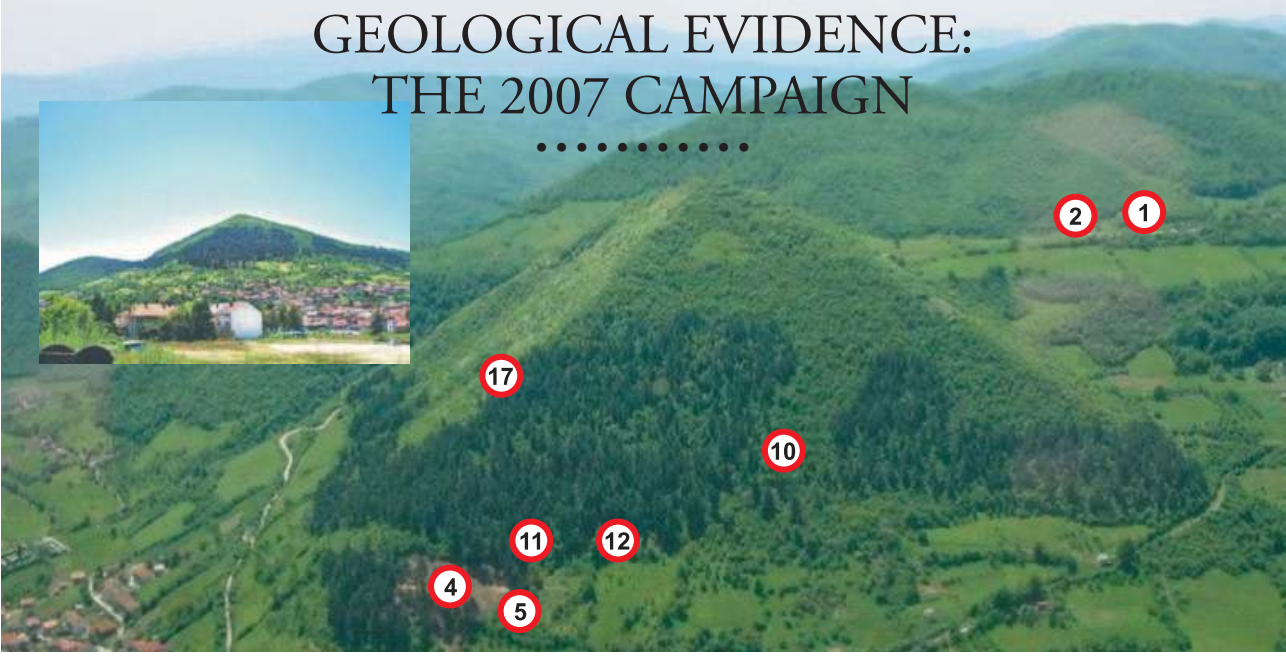

Figure 104. The Bosnian Pyramid of the Sun (Visočica) – a map of the research probes. Preliminary results of the geometry research of the Sun Pyramid's northern side demonstrated that the northern side is approximately 220 meters tall. As a comparison, Khufu's pyramid in Egypt is 146 meters tall.

Figure 105. Probe 4

Figure 115. Gornja Vratnica – the Toprakalija tumulus

Figure 116. the Toprakalija tumulus – multilayer structure

Figure 117. the Toprakalija tumulus – stones with a wavelike pattern

ARCHEOLOGICAL EVIDENCE FROM UNDERGROUND TUNNELS

There are numerous indications that point towards the existence of a network of underground tunnels that connect the pyramidal objects in the Bosnian valley of pyramids. The first ancient archeological artifacts have already been found – manmade monolith sandstone plates.

Figure 118. Interior of the „Ravne“ tunnel

Figure 119. Author Hrvoje Zujić, next to the K-1 megalith in the Ravne tunnel

CHAPTER SIXTEEN

COMPARISON OF THE FINDINGS

Figure 120. Visoko. Interior of the KTK tunnel – a roof beam made of stone (photographed by the author) – smooth walls and cuts made at right angles.

Figure 121. Giseh. Interior of one of the tunnels below the plateau. The relatively smooth walls and cuts made at right angles in the limestone are visible – from the book „The land of Oziris“ (Copyright by Stephen S. Mehler)

From the images, it is obvious that the tunnels in Visoko are of a similar appearance and construction type as the tunnels below the plateau in Giseh.

The massive stone altar discovered in the KTK tunnel in Visoko resembles the altar in Abu Ghurob.

Figure 122. „Stone altar" – discovered in the KTK tunnel (photographed by the author)

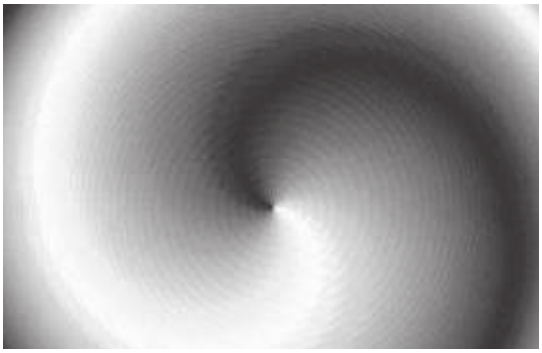
BOOK FIVE

BIOENERGETIC PULSATORS



CHAPTER SEVENTEEN

THE MUSIC-MAKING OF ENERGY PULSATORS

Our humble opinion is that now it is time to conclude our explanations regarding the functional energetics of the pyramid, of which so many have been constructed, and to bring to this book to an end.

No theory will be able to disrupt the harmony of the pyramids and the beauty of these old buildings that proudly count the centuries of their existence.

No man, no matter how much he tries, will be able to diminish their magic of ages with his explanations and theories.

Many generations have spent their lives alongside these pyramids and crumbled into the dust of history, but these glamurous buildings have reached our present through our past, tempting us to solve their enigma, which is leading us into a new energetic future.

So, regardless of how much anyone might try to ignore them and their energetic functionality, it will come to naught, because they exist and they are dispersed all over the world, as are thousands of stone spheres.

Their geometric-energetic harmony and the way they were constructed have never been fully explained, as if they are defying all the knowledge and the laws of present-day science and the many aspiring erudites of this world.

At the end of all the brave ideas mentioned in this book, we can conclude that any theoretical explanation that can lead us a step closer to the truth is worth the attention and the effort.

Sometimes it suffices to provoke someone's interest by means of theoretical explanations in order to arrive at the real solution and the genuine truth. And, anyway, there is always but a single truth.

THE INVISIBLE AND INAUDIBLE MUSIC OF THE SPHERES

The biophotonic emission of the outburst at the top of the pyramid happens in intervals, in energy quantums. This is a magnified image of the energy manifestations of the Bosnian Pyramid of the Sun. In the making of this image, the PIP technology invented by innovator Dr. Harry Oldfield was used, and it is called the polycontrast interference photography.

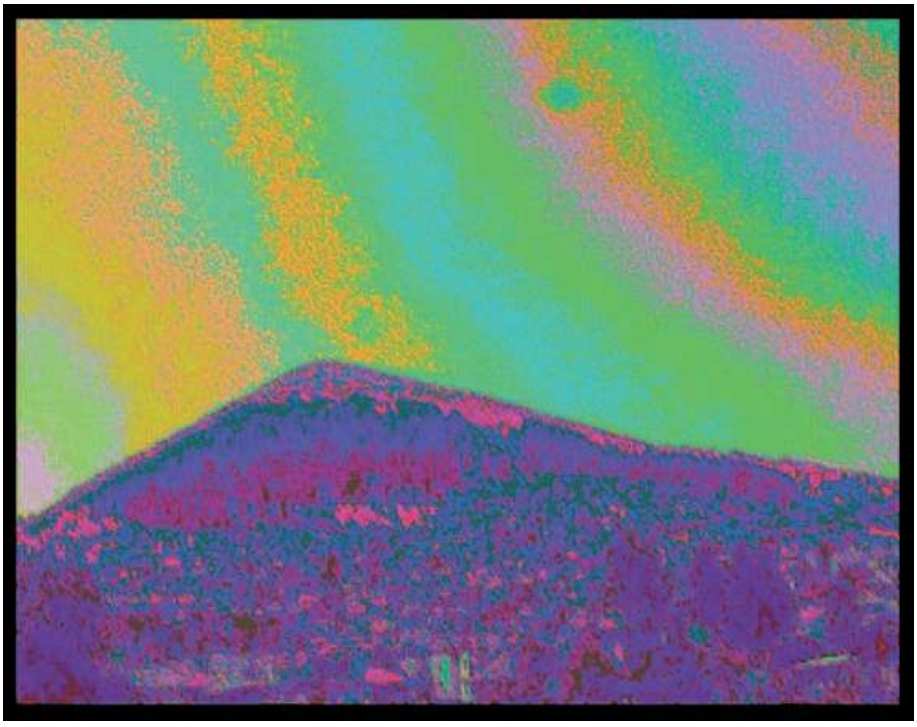


Figure 124. A polycontrast interference photo of the Bosnian Pyramid of the Sun (Copyright 2007 by Harry Oldfield)

These interval quantum biophotonic outbursts, locally at the pyramid, is accompanied by mild stresses within the natural magnetic and gravitational field, the quakes of which can be measured.

This type of impulse high voltage outbursts were called scalar waves by Nikola Tesla, and they are electromagnetic gravitational waves, whose outburst interval is between 4 and 14 Hz.

CHAPTER EIGHTEEN

SEISMICITY OF THE SARAJEVO AREA

In the Sarajevo city area, there are almost daily earthquakes of an intensity of less than III degress on the Mercalli intensity scale, which are only registered by instruments. The epicentral areas of these earthquakes are Pale, Prača, Hrasno, Trebević, Vučja Luka and Vogošća. Stronger earthquakes are relatively rare. During a single year, around 100 earthquakes are registered in the territory of the Sarajevo canton. The depth of the hypocenters is between 4 and 30 kilometers. Of this number, there are two to three earthquakes that can actually cause perceptible trembling of the ground, or do some minor damage on structures. Since 1900, i.e. since earthquakes are instrumentally registered in this area, there were 74 recorded earthquakes with a magnitude of over 3.0 degrees on the Richter scale, or of an intensity of more than V degrees on the Mercalli scale; in other words, these are earthquakes which caused material damage or loss of human life. According to the available data, the most powerful earthquake in Sarajevo (among those that were recorded with instruments) happened in 1962. The epicentre was in the Treskavica mountain, some 30 kilometers to the south of the city of Sarajevo. In the epicentre, the intensity of the earthquake was VIII degrees on the Mercalli scale, and in the city area it was VII degrees.

(from the website of the Hydrometeorologic institute of the Federation of Bosnia and Herzegovina)

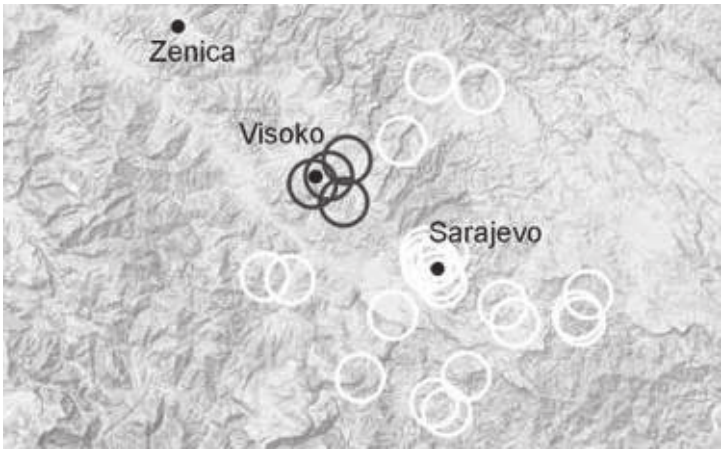

Figure 125. A map of epicentres of stronger earthquakes in the Sarajevo area and its surroundings between 1900 and 2000. The earthquakes in Visoko are labeled with dark rings.

O. B. Khavroshkin, Ph. D.

V. V. Tsyplakov, Ph. D.

Russian geophysicists Khavroshkin and Tsyplakov have surveyed the local trembling in the area of the Bosnian valley of pyramids. At the Zbilje location, the northern side of the Temple of the Earth (Krstac), they have registered a signal of a seismic noise at a frequency of 13 Hz coming from an unknown source (Figure 126).

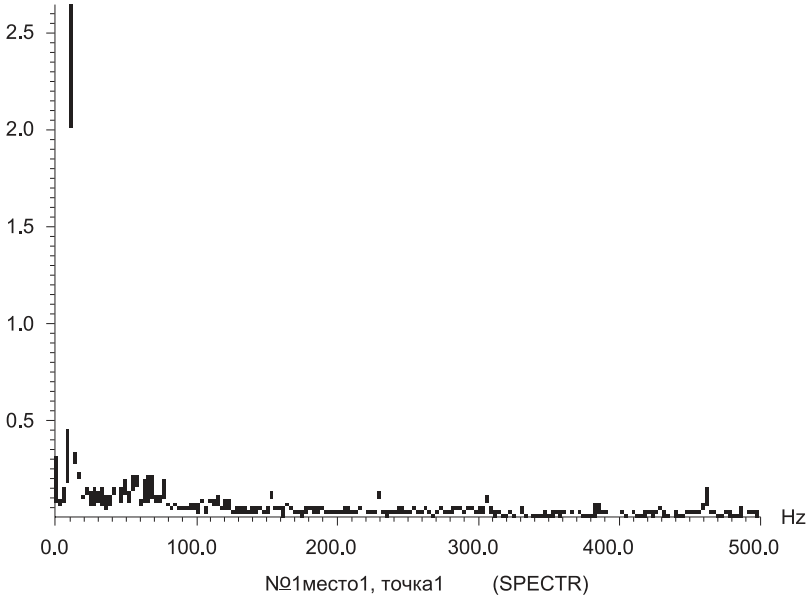

Figure 126. Temple of the Earth (Krstac) – seismic noise signal

This is a graphical display of only one measurement among many, which these scientists have conducted in the area of the Visoko Valley of pyramids. It can be said with a great degree of certainty that the seismic noise at the frequency of 13 Hz is the consequence of the energy discharge of the hill (Krstac). Let us remind ourselves that Nikola Tesla's scalar waves burst out in a 4 – 14 Hz rhythm and that they cause mild local trembling, which is exactly what is happening here.

CHAPTER NINETEEN

INTERPRETATION OF THE SYMBOLS ON MEGALITH K-1

In April 2006, during the prospection of the Ravne tunnel, a stone block was found, the megalith K-1.

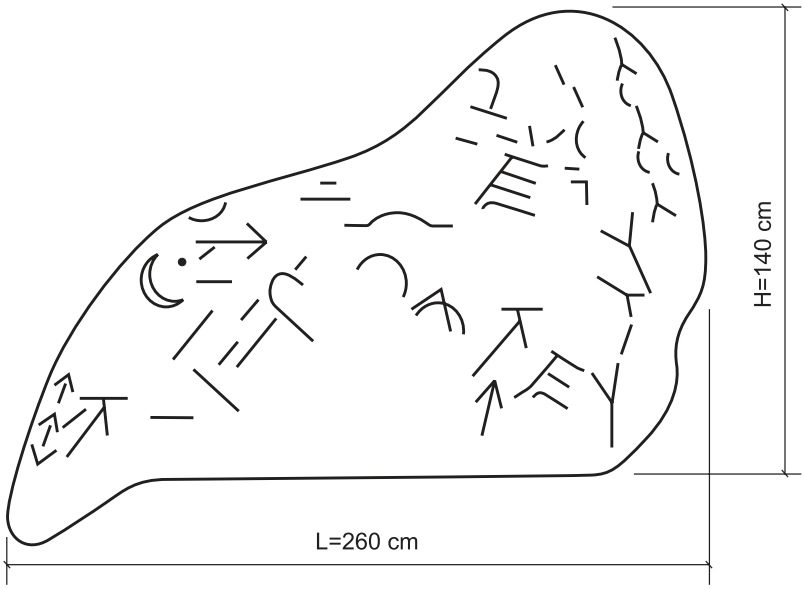

Figure 127. Visoko. A sketch of the megalith K-1 with symbols, author Muris Osmanagić, Ph.D.

The sketch of the K-1 megalith contains symbols which are assumed to represent a schematic of the energy objects in the area of the Bosnian valley of pyramids.

While decyphering the symbols from the K-1 megalith, we have discovered similarities in S. Mehler's book „The land of Osiris" between these symbols and the symbols from the Edfu plate in the Temple of Horus.

Figure 128. Edfu. The Temple of Horus. In the center, there are Per-neter (pyramid) and Asgat (water) signs – from the book „Land of Osiris“ (Copyright by Stephen S. Mehler)

There is an obvious resemblance between the symbol and the symbol from the K-1 megalith, and the symbol from the plate in the Horus temple in Edfu. Figure 129 demonstrates a relief form which resembles the „Y“ symbol, and there are all of six of these symbols on the K-1 megalith. This is why we should assume that the underground tunnel network in this area has several entrances in various locations. A banana-shaped indentation from the K-1 megalith resembles the relief shape of the Temple of the Earth (Krstac) elevation. There is a continuous research of the meanings behind the symbols from the K-1 megalith, and the general opinion is that the straight line symbols represent underground water currents. The symbol next to the Earth temple label implies a source of ground orgone at the Zbilje location.

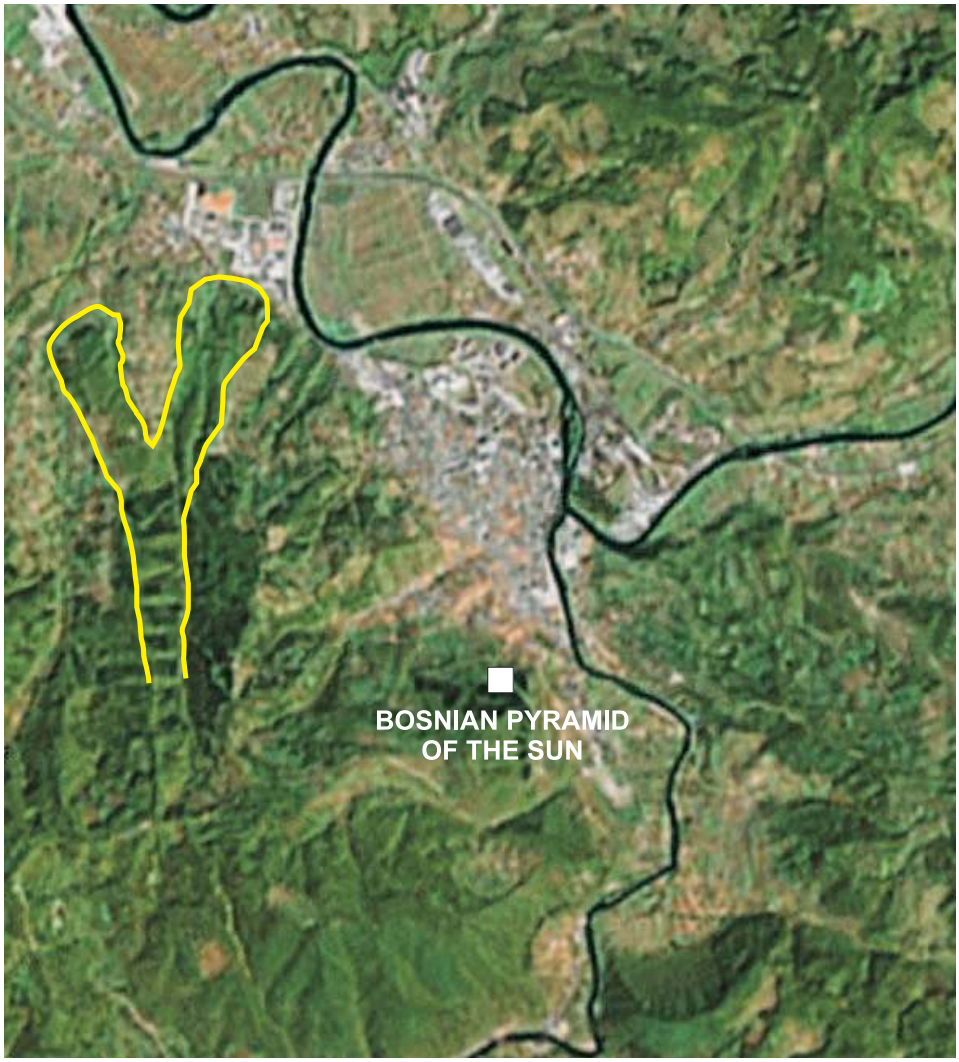

Figure 129. Satellite image above the Ravne tunnel

A satellite image, which can be seen on GOOGLE EARTH, shows the underground tunnel network Ravne, north-west of the Bosnian Pyramid of the Sun, the shape of which resembles the letter „Y“. The AQUA MUNDI company has registered subterranean cavities at the Topuzovo Polje location, which extend all the way to the Ravne tunnel. To support these hypotheses, here are the statements from the book „Visoko and its surroundings throughout history I“:

„Topuzovo Polje. As far as the cave in the vicinity of Trivunovo Vrelo is concerned, the first twenty meters of which were passable, people say that it

extended to Vilindo. From this point, an underground passage led to the old city of Visoko."

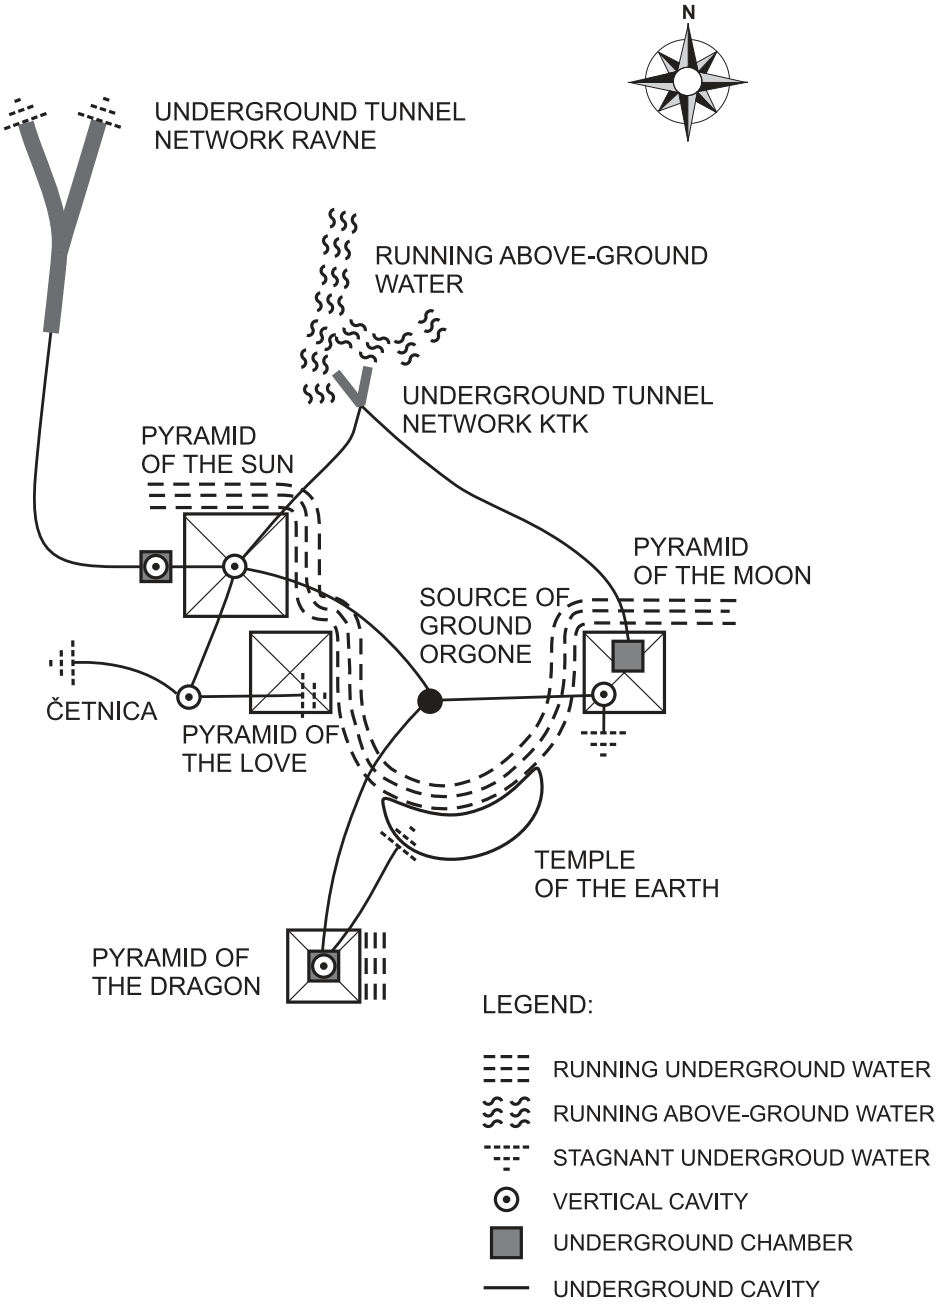

Figure 130. Records of the survey conducted by the Belgrade company AQUA MUNDI

Figure 131. a) „Cave“ probe in the Bosnian Pyramid of the Moon

Picture 131. b) Symbol of arrow engraved in stone on the probe “Cave”

Through visual observation and sensitive instrumental measurements, all the mentioned effectives were registered, as is shown in Figure 130. At the archeological site of the Pyramid of the Moon, many excavations were performed, and the only arrow symbols chiseled into stone were thus far discovered at the „Cave“ probe, where Miodrag Popović from the AQUA MUNDI company registered a vertical cavity.

ENERGY PULSATORS
(Author's note)

Sign description:

Visočica – Bosnian Pyramid of the Sun
Plješivica – Bosnian Pyramid of the Moon
Bučki Gaj – Bosnian Pyramid of the Dragon
Čemerac – Bosnian Pyramid of the Love
Krstac – Temple of the Earth
Četnica – energetic hill
Strmac – energetic hill

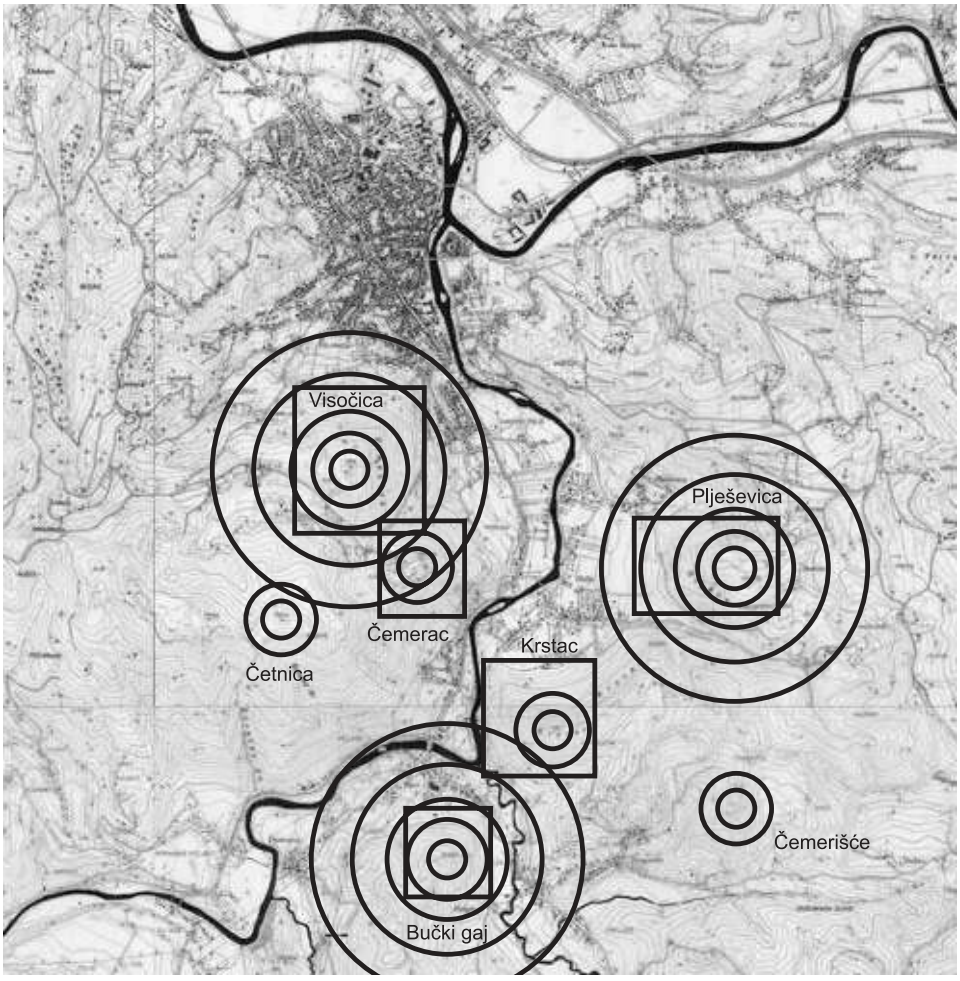

Figure 132. Anomalous elevations in the Visoko valley.

CHAPTER TWENTY

ENERGETIC GEOMETRIC SYMPHONY AT WORK

ENERGY OSCILLATORS IN A RHYTHMIC PULSATION AND THE MOTION OF ORGONE ACCORDING TO SPIRAL LAWS OF THE UNIVERSE (FORAMINIFERA)

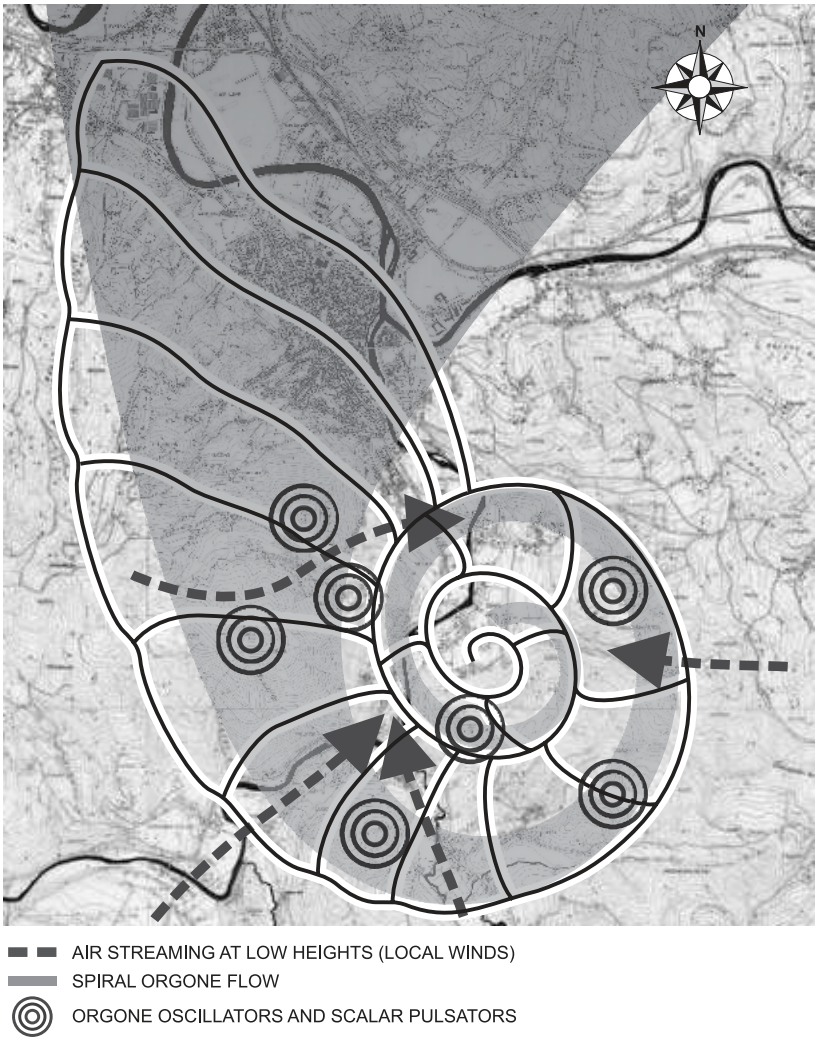

Figure 133. Visoko, Bosnia and Herzegovina. Schematic display of the operation and the operative direction of one of the oldest orgone air conditionings in the world

Explanation of orgone-casade generator's operation in the Visoko valley area (Figure 132 and 133).

Let us assume that the pyramidal hills in the Visoko valley area, along with all the previously mentioned facilities (underground and aboveground water currents, many kilometers of moist underground tunnels, natural caves and vertical cavities, and the presence of huge amounts of paramagnetic and diamagnetic materials, which are a component of all hills), collectively were a gigantic cascade power plant of orgone energy. This huge amount of produced orgone (energy which is necessary for life) has simply spilled over into the fertile area of the Visoko valley, since orgone loves water. The Bosna river is the ideal direction of the spilling of this anti-meteorologic energy product. With the Fibonacci spiral system, this accumulated orgone provided the Visoko valley with a sufficient amount of precipitation and life energy.

We can safely say that these power plants, which were probably the oldest in the world, represented some kind of naturally driven air conditioning, and that they supplied this whole area with free energy, useful for plants, people and animals, many centuries after they were initially started.

Research in the Visoko valley area indicates that the source of ground orgone is in the Zbilje location, and that it passes in front of Krstac (the banana-shaped hill) in a rightward rotation, that it rises and rotates in front of the Čemerac hill (Bosnian Pyramid of the Love), then goes to Plješivica (Bosnian Pyramid of the Moon), crossing Strmac and all the way to Buci hill (Bosnian Pyramid of the Dragon), and then it passes the Četnica hill and reaches the Visočica hill (Bosnian Pyramid of the Sun), until it eventually leaves toward the Visoko valley and the Bosna river. The operation of energetic orgone pulsators is shown in Figure 132, and a schematic graphical display of orgone motion is shown in Figure 133, in a comparison with the Foraminifera snail, i.e. the Fibonacci spiral system, according to which all the energy of the universe moves.

Details on this oldest and possibly largest power plant in the world, which is located in Visoko, in Bosnia and Herzegovina, will be presented in the forthcoming book, which is already partly written, with many details, images, graphics, and measurements.

CHAPTER TWENTY-ONE

CONCLUSIONS

In an attempt to reconcile physics and paraphysics, we have often – consciously or not - made a few steps further from what has been determined by classical physics up to this point. By doing so, we wanted to emphasize the possibility of the reconciliation of old wisdom and new knowledge.

As far as pyramids are concerned, it can safely be said that these are ancient monuments to the builders of disappeared civilizations, monuments to their intelectual and architectural skills which, regardless of whether we are ready to admit this, render present-day science speechless.

It can also be said that all the knowledge we are aware of is built into the pyramids, knowledge from all areas of science, and probably even those we are yet to discover.

Pyramids are multifunctional systems which are – not without reason – admired by the whole world. Regardless of when they were built, they still exceed all our scientific notions, because they functionally exceed the effectives of the three-dimensional world of the physical level. They point us toward accepting the unity with the multidimensional space of the universe.

Pyramids direct us from their distant past into our new future, in which we will have to change many of the currently valid laws and accepted concepts of natural energetic processes that surround us and connect us with the expanses of the universe.

The late Nikola Tesla dedicated an entire area of his research to the research of scalar waves, and he called it „scalar electronics". He was researching paranormal phenomena as well, like many of the world's scientists. The area of scalar electronics is not well known to the public. With the use of scalar waves in the consideration of paranormal phenomena, one can explain everything. There are no wonders, there is just knowledge, or a lack thereof.

Pyramids, just like the thousands of stone spheres that can be found all around the world, point us toward the truth that we are floating in a sea of energy, that everything is energy, and it comes in a variety of densities and subtleties, and that the universe, of which we know so little, is of a very wise nature.

WHAT ARE PYRAMIDS?

- orgone accumulators
- scalar generators
- massive energetic oscillators
- psychotronic communicators

WHAT ARE STONE SPHERES?

- miniature power plants which, by multiplying energetic effects, achieve the same effectives as the pyramids, but of a much lesser power.

WHAT ARE THE PYRAMIDS IN VISOKO, IN BOSNIA AND HERZEGOVINA?

- they are some of the largest and oldest power plants in the world

WHAT IS ORGONE?

- Orgone is a multidimensional, living and spiritual fluid, which permeats all the material and immaterial space of the universe, maintaining its eternal life

WHAT ARE SCALAR WAVES?

- scalar waves, in the relations mentioned in this book, represent an energetic and informational connective tissue of interplanetary, intergalactic and spatial-temporal dimensions. Scalar waves, with their limitless spatial-informational possibilities mutually connect this eternal and all-permeating universe, which has its own physical and energetic body and mind

And so, we have arrived at the end of this book, which opens new views on pyramids and stone spheres that can be found anywhere in the world, with a special review of the pyramidal objects in Visoko, in Bosnia and Herzegovina.

The surveys conducted by the Belgrade company AQUA MUNDI confirm that the whole area of the Bosnian pyramids is permeated with underground tunnels, which was also confirmed by partial excavations. Through measurements, it was determined that the area between these pyramidal elevations is permeated by an entire network of underground water currents.

Through the instrumental measurements conducted by the Russian geophysicists Khavroshkin and Tsyplakov, with a geophone, seismometer and a chemotron, it was determined that the earth constantly trembles in several locations in this area, which is not a cause, but a consequence of the energy outbursts of orgone and scalar waves.

By visiting the mentioned facilities in the Visoko valley of pyramids, and by making photos and recordings of the locations at which excavations were conducted, it can be easily determined that there are layers of paramagnetic and diamagnetic materials, of which these hills are made. This is why we claim that these elevations, regardless of whether we call them hills or pyramids, have their own orgone-energetic function, regardless of whether it is natural, artificial, or just added, i.e. modeled (terraformed).

There is not a single reason why the united resources of the existing institutions of Bosnia and Herzegovina, the „Bosnian Pyramid of the Sun" foundation, and all the other enthusiasts from around the world shouldn't be used for further research into this fabulous work of ancient builders, since this is a world heritage site which simply happens to be in the territory of Bosnia and Herzegovina.

While explaining this new theory regarding the functioning of all pyramids and stone spheres, we have tried – as much as possible – to lean on the classic postulations of present-day physics and electrical engineering, but we had to enter the area of paraphysics. This is the domain of our professions, our knowledges and skills.

All the other claims, regarding pyramids in the world, or those in Bosnia and Herzegovina, we shall leave to the expert observation of those who are more familiar with these scientific areas than we are.

The desire and aspiration behind our new theory and view of the energetic functioning of the pyramids, which we expressed in words, graphics, and measured data, was that it would stimulate people who are interested in this subject to rethink, as well as those who are in the search of the truth.

ABOUT THE AUTHORS

Vilim Kanjski was born on 25 June 1942 in Velika Maslenjača, in the Daruvar muncipality, Republic of Croatia.

He has spent his entire working life on various duties in economy, and he is retired now.

He has been researching the area of the „Energy of fields in the human environment, and their impact on health" for all of thirty years.

After 15 years of the „Biovilk" radiobiology research program, he has written – together with the In club Rijeka – a book titled „Man in the environment of harmful radiation".

As a lecturer, he has participated in three international scientific congresses „Society and technology" which were held under the patronage of the Ministry of science and technology of the Republic of Croatia.

He participated in many radio and television programs dealing with borderline areas of science, and he is the constructor of several devices.

The inventions from the „Biovilk" development program, which lasted for all of 30 years, were presented at the largest international expositions in Croatia, Italy, Belgium, Germany, England, Morocco, and the U.S.A.

For his innovations, he won: four gold medals, one golden sail, two gold diplomas, four silver medals, three bronze medals, one Grand Prix of the exposition in Morocco, the Certificate of technical culture of Croatia, the Charter of the Croatian society of innovators, and the Certificate of the Croatian chamber of economy – county chamber Rijeka.

His works were published in the journals of international scientific congresses, organized by the Architecture faculty in Rijeka, in the edition „How to become an entrepreneur", and in the book „Managament and entrepreneurship" published by the Nutritional-biotechnological faculty of the University of Zagreb.

Hrvoje Zujić was born on 9 March 1970 in Osijek, Croatia.

He has a master degree of electrical engineering, an authorized engineer of electrical enginnering for the design and control of electric installations.

Since 1998, he has been a member of the Class of electrical engineers of the Croatian chamber of architects and architectural engineers, www.hkaig.hr.

For 15 years, he has been researching geopathic radiation, bioenergy, biophysics, biomedical electronics, polycontrast intereference photography.

He is a pyramidologist, and a researcher into borderline areas of science.

Picture 134. Standing from left to right: the authors of the book, Hrvoje Zujić and Vilim Kanjski, next to them is our best field researcher Zoran Kocić, and next to him is Edin Suša who was so generous to let us use his holiday house, in front of which the picture was taken and where we worked on processing of this book during the whole time of field research works in Valley of pyramids near Visoko. We use this opportunity to express our gratitude to him.

Visoko, 04-03-2008
